PHYSICS AND MATHEMATICS

**FBIS** FOREIGN BROADCAST INFORMATION SERVICE

#### NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

#### PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service (NTIS), Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semimonthly by the NTIS, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

Soviet books and journal articles displaying a copyright notice are reproduced and sold by NTIS with permission of the copyright agency of the Soviet Union. Permission for further reproduction must be obtained from copyright owner.

## PHYSICS AND MATHEMATICS

### CONTENTS

#### CRYSTAL, LASER GLASSES AND SEMICONDUCTORS

Polarized Luminescence in the Visible and Infrared Areas of the Spectrum of Color Centers in $\alpha$ - $\text{Al}_2\text{O}_3$ (Ye. F. Martynovich, A. G. Tokharev, et al.; OPTIKA I SPEKTROSKOPIYA, No 2, Aug 86).....	1
Study of Thermoluminescence of Yttrium-Aluminum-Garnet Crystals Doped With Neodymium Neodymium (V. M. Garmash, G. A. Yermakov, et al.; OPTIKA I SPEKTROSKOPIYA, No 3, Sep 86).....	2
High Energy Levels of the $\text{Cr}^{3+}$ Ion in $\text{Y}_3\text{Al}_5\text{O}_{12}$ (I. S. Borban, A. F. Gumenyuk, et al.; OPTIKA I SPEKTROSKOPIYA, No 3, Sep 86).....	2
EPR of Mn - Centers in Regular Environment in a KCl Crystal (A. G. Badalyan, M. M. Petrosyan, et al.; FIZIKA TVERDOGO TELA, No 8, Aug 86).....	3
Absorption of Acoustic Waves in $\text{Bi}_4\text{Ge}_3\text{O}_{12}$ Crystals (S. N. Ivanov, V. F. Kargin, et al.; FIZIKA TVERDOGO TELA, No 6, Jun 86).....	4
On Magneto-optical Anisotropy of Rare-Earth Crystals (A. K. Zvezdin, A. I. Popov, et al.; FIZIKA TVERDOGO TELA, No 6, Jun 86).....	5

Monte-Carlo Simulation of Yb <sup>3+</sup> Optical Centers in Silicate Glass (A. P. Zenkov, A. K. Przhevuskiy; FIZIKA TVERDOGO TELA, No 6, Jun 86).....	6
Raman Spectra and High Temperature Ferroelectric Phase Transition in LiN(H <sub>x</sub> D <sub>1-x</sub> ) <sub>4</sub> SO <sub>4</sub> (V. I. Torgashov, Yu. I. Yuzyuk, et al.; FIZIKA TVERDOGO TELA, No 6, Jun 86).....	7
F <sub>4</sub> <sup>+</sup> - Centers in Li-F Crystals (L. I. Shchepina, Z. I. Myreyeva, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 86).....	8
Polymer Laser Elements With Arenonium Active Centers (A. Ya. Gorelenko, I. I. Kalosha, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 86).....	9
Generation of Al O :Ti Crystals in Continuous and Quasi-Continuous Mode (G. S. Kruglik, G. A. Skripko, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Oct 86).....	10
Relation Between Formation of Unstable Color Centers in Laser Crystals and Emission Characteristics of Such Crystals (L. G. Karaseva, N. Yu. Konstantinov, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Aug 86).....	11
New Achievements in Crystal Science (B. K. Vaynshteyn; VESTNIK AKADEMII NAUK SSSR; No 9, Sep 86).....	12
Growing Heteroepitaxial Ge Layers on GaAs Substrate From Cooled Solid Solution (N. P. Yurchenko, G. I. Bagalin; POVERKHNOST: FIZIKA KHIMIYA, MEKHANIKA, No 10, Oct 86).....	12
Phase Phenomena in Parametric Generators and Amplifiers of Ultrashort Light Pulses (A. Piskarkas, A. Stabinis, et al.; USPEKHI FIZICHESKIKH NAUK, No 1, Sep 86).....	13
LASERS	
Dimensions of Ignition Zones in Blow-Outs of Combustible Gases From Rectangular and Circular Ports (Yu. A. Kondrashkov, V. P. Tomilin, et al.; FIZIKA GORENIYA I VZRYVA, No 5, Sep-Oct 86).....	14

## FLUID DYNAMICS

- Negative Energy Waves in Hydrodynamics  
(L. A. Ostrovskiy, S. A. Rybak, et al.; USPEKHI  
FIZICHESKIKH NAUK, No 3, Nov 86)..... 15

- On Surface Non-Linear Acoustic Interactions in Fluids  
(N. I. Pushkina; DOKLADY AKADEMII NAUK SSSR, No 1, 1986)... 16

## HIGH TEMPERATURE PHYSICS

- Device For Studying Thermal Conductivity of Structural  
Materials at High Temperatures  
(V. E. Piletskiy, L. G. Patrusheva; TEPILOFIZIKA  
VYSOKIKH TEMPERATUR, No 1, 1986)..... 17

- Instrumentation For Studying Reflectivity Ratio of Partially  
Transparent Materials at Extremely High Temperatures  
(S. V. Krayushkin, A. F. Parfenovich, et al.;  
TEPILOFIZIKA VYSOKIKH TEMPERATUR, No 1, 1986)..... 18

## LASERS

- Time Characteristics of Travelling Wave Lasing With Two-Photon  
Picosecond Optical Pumping  
(V. I. Prokhorenko, Ye. A. Tikhonov; KVANTOVAYA  
ELEKTRONIKA, No 9, Sep 86)..... 19

- Increasing Time Resolution of Picosecond Absorption Spectrometer  
by Selection of Length of Laser Light Pulses  
(B. N. Korvatovskiy, V. V. Gorokhov, et al.;  
KVANTOVAYA ELEKTRONIKA, No 9, Sep 86)..... 20

- Dynamic Restructuring of Pulsed CO<sub>2</sub> Laser Frequency and  
Multiple-Peak Generation in a Cell With IR-Absorbing Gas in  
the Resonator  
(G. N. Makarov; KVANTOVAYA ELEKTRONIKA, No 9, Sep 86)..... 20

- Causes and Distribution of Failures in Semiconductor Lasers  
(a Review)  
(P. G. Yeliseyev; KVANTOVAYA ELEKTRONIKA, No 9, Sep 86).... 21

- Study of Vibration Relaxation in Active Medium of CO<sub>2</sub>- Laser  
Using Phase-Absorption Method  
(B. F. Kuntsevich, A. N. Pisarchik, et al.; ZHURNAL  
PRIKLADNOY SPEKTROSKOPII, No 3, Mar 86)..... 22

- TEA-TE: Powerful Nitrogen-Based Laser System  
(Yu. V. Zvinevich, I. N. Kazimirchik, et al.; ZHURNAL  
PRIKLADNOY SPEKTROSKOPII, No 3, Mar 86)..... 23

Intracavity Spectrum Analyzer With $\text{NaF:F}_2^+:\text{F}_3^-$ Crystal Laser For Long-Wave IR Wave Band (V. A. Vratskiy, A. N. Kolerov; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 86).....	24
Study of Kinetics of Intracavity Absorption in Pulsed Dye Lasers (V. S. Burakov, V. A. Malashonok, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 86).....	25
Effect of Multiplication of Spectral Components of Multi- Frequency Lasing of Pulsed Tunable Laser (V. I. Kravchenko, V. V. Taranov; PISMA V ZHURNAL TEKHNICHESLOY FIZIKI, No 22, 26 Nov 86).....	26
Characteristics of LKI-501 Tunable Dye Laser With Dyes in Solid Matrix (A. I. Zhiltsov, A. G. Klimashina, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 1, Jul 86).....	27
Dye Laser For Holographic Interferometry (I. S. Zeylikovich, A. M. Lyalikov, et al.; KVANTONAYA ELEKTRONIKA, No 7, Jul 86).....	27
Generation of Light Pulses in Semiconductor Laser Upon Excitation by Several Election Beams (K. V. Aleksandrovich, V. V. Druzhinin, et al.; KVANTOVAYA ELEKTRONIKA, No 7, Jul 86).....	28
NUCLEAR PHYSICS	
On Formation of Mass Distributions of Fragments of Fission of Nuclei Lighter Than Thorium (M. G. Itkis, S. I. Mulgin, et al.; YADERNAYA FIZIKA, No 5, May 86).....	30
Mass Distributions of Fission Fragments of Heated Nuclei and Droplet Model (Ye. N. Gruzintsev, M. G. Itkis, et al.; YADERNAYA FIZIKA, No 5, May 86).....	31
Cherenkov Atom Radiation (M. Ya. Amusya, A. V. Solovyov; PISMA V ZHURNAL TEKHNICHESLOY FIZIKI, No 22, 26 Nov 86).....	32
Microscopic Calculations of Energy and Transitional Densities of Gigantic Monopolistic Resonances in Nuclei (M. V. Stoitsov, I. Zh. Petkov, et al.; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 10, Oct 86)...	33

Four-Lepton Decays and Electromagnetic Radius of K-Meson (D. A. Mzhaviya, G. V. Mitselmakher, et al.; YADERNAYA FIZIKA, No 4(10), Aug 86).....	34
Gluon Structure and the Strong Interactions of High-Energy Hadrons (A. V. Kiselev, V. A. Petrov; YADERNAYA FIZIKA, No 4(10), Aug 86).....	34
Occurrence of Boson Resonances During $\bar{p}p$ -Interactions at 32 GeV/s (Ye. A. Kozlovskiy, V. A. Bumazhnov, et. al.; YADERNAYA FIZIKA, No 4(10), Aug 86).....	35
Electromagnetic Properties of Neutrino in Supersymmetric Theories (T. M. Aliyev; YADERNAYA FIZIKA, No 4(10), Aug 86).....	36
Inverse Problem For Quantum Theory of Scattering in New Formulation (I. V. Poplavskiy, A. A. Shiyan; YADERNAYA FIZIKA, No 4(10), Aug 86).....	36
Passage of Fissile Nucleus Through Barrier to Scission in Multidimensional Diffusion Model (G. D. Adeyev, N. I. Pischasov; YADERNAYA FIZIKA, No 4(10), Aug 86).....	37
Search For New Mechanism of Nuclear Fission by High-Energy Protons Based on Isotope Distributions of Fragments (B. N. Belyayev, V. D. Domkin, et al.; YADERNAYA FIZIKA, No 4(10), Oct 86).....	38
Image Recording in Neutron Microscope (S. S. Arzumanov, S. V. Masalovich, et al.; PISMA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI, No 5, 10 Sep 86).....	38
Universal Liquid-Hydrogen Source of Polarized Cold and Ultracold Neutrons in VVR-M Hydrogen-Moderated Hydrogen- Cooled Reactor at Leningrad Institute of Nuclear Physics (I. S. Altarev, N. V. Borovikova, et al.; PISMA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKA, No 6, 25 Sep 86).....	39

#### OPTICS AND SPECTROSCOPY

Propagation of Radiation Along a Constricting Optical Waveguide (V. M. Andreyev, K. F. Yeskin, et al.; OPTIKA I SPEKTROSKOPIYA, No 2, Aug 86).....	41
--	----

Cross Section of Resonant Raman Scattering of Light by Polyenes (V. V. Verdyugin, K. Ya. Burshteyn, et al.; OPTIKA I SPEKTROSKOPIYA, No 2, Aug 86).....	41
Cr <sup>3+</sup> Spectroscopy in Position With Center of Symmetry in Alexandrite (A. P. Yeliseyev, A. M. Yurkin, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 3, Mar 86).....	43
Certain Luminescent Properties of GaN:(Zn-O) Structures (M. D. Shagalov, Ya. D. Lebedev; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 3, Mar 86).....	44
Excitation Spectrum of Visible Light - Simulated Recommendation Luminescence of Gamma-Irradiated Copolymers of Methyl Methacrylate With Dimethacryloxymethyl Antracen (S. V. Lotnik, V. N. Korobeynikova, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 3, Mar 86).....	45
Heating of Helium Plasma by Powerful Proton Beam For Spectroscopic Purposes (M. S. Arteyev, A. A. Kuznetsov, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 86).....	46
Dmitriy Sergeyevich Rozhdestvenskiy: Founder of the First Soviet Optical School (on the 110-th Birthday Anniversary) (Yu. A. Khramov; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Apr 86).....	47
Interferometry Method For Measuring Coefficient of Radiation Transmission (A. P. Burmakov, A. V. Kolesnik, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Oct 86).....	48
Triplet-Triplet Annihilation of Molecules of Aromatic Hydrocarbons and Dyes in Solutions (L. V. Levshin, G. A. Ketsle, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 4, Oct 86).....	49
Effect of Adding to Xenon Other Inert Gases on Luminescence Yield of Xe <sub>2</sub> <sup>*</sup> - Molecules Excited by Electron Beam (Yu. I. Dymshits, V. A. Korobitsyn (deceased); ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 1, Jul 86).....	51
Soliton Mode of Propagation of Light Pulses Through Single-Mode Optical Fibers and Problems of Its Experimental Realization (V. Yu. Petrunkin, A. V. Selishev, et al.; PISMA V ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 16, 26 Aug 86).....	51

Absorption Power of SiO Vapor in $X^1\Sigma$ $A^1\Pi$ and $X^1\Sigma$ $E^1\Sigma$ Electron Bands at High Temperatures (V. S. Matveyev; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 2, Aug 86).....	52
Picosecond Spectroscopy of Intermolecular Proton Phototransfer (G. M. Yesayan, O. V. Kalaydzidis, et al.; KVANTOVAYA ELEKTRONIKA, No 7, Jul 86).....	53
Non-Linear Mode of Optical Excitation of Rayleigh Waves in Silicon; Thermoelastic and Concentration-Deformation Mechanism (S. M. Avanesyan, V. E. Gusyev, et al.; PISMA V ZHURNAL TEKHNIЧЕСКОY FIZIKI, No 17, Sep 86).....	54
Resolving Power of Tunneling Microscope (M. V. Krylov, R. A. Suris; POVERKHNOST: FIZIKA, KHIMIYA, MEKHANIKA, No 10, Oct 86).....	55
Fluorescence of Oxazine-17 in Proton Donor and Proton Acceptor Solvents Upon Steady or Picosecond-Pulse Excitation (B. A. Bushuk, A. N. Rubinov, et al.; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 3, Sep 86).....	55
Laser Photionization Spectroscopy of Self-Ionization States of Thulium Atom (A. A. Atakhodzhayev, V. N. Fedoseyev; ZHURNAL PRIKLADNOY SPEKTROSKOPII, No 3, Sep 86).....	56

#### PLASMA PHYSICS

Confinement of Ions in Magnetic-Mirror Trap With Small Mirror Ratio (V. I. Yerofeyev, D. D. Ryutov; FIZIKA PLAZMY, No 10, Oct 86).....	58
Equilibrium of Plasma With Finite Larmor Radius in Open Traps (G. V. Stupakov; FIZIKA PLAZMY, No 10, Oct 86).....	59

#### TECHNICAL PHYSICS

Conversion of Optical Waveguide Modes in Gyroanisotropic Planar Waveguides (A. A. Solomko, Yu. A. Gayday, et al.; OPTIKA I SPEKTROSKOPIYA, No 3, Sep 86).....	60
Photoemission Method of Identification of Narrow-Band Spectra in Rapid Processes (A. I. Terpuloyeskiy, K. N. Kasparov; OPTIKA I SPEKTROSKOPIYA, No 3, Sep 86).....	60

Multilayer Holographic Functional Element in Analog-Digital Converter (N. N. Yevtikhiyev, D. I. Mirovitskiy, et al.; KVANTOVAYA ELEKTRONIKA, No 9, Sep 86).....	61
Influence of Sound on Diffusion of Interstitial Impurity Atoms in a Solid (A. S. Bakay, N. P. Lazarev; FIZIKA TVERDOGO TELA, No 8, Aug 86).....	62
Assessment of Anomalous Gravitational Field of Elastic Earth (Zh. S. Yerzhanov, A. A. Kalybayev, et al.; IZVESTIYA AKADEMII NAUK KAZAKHSKOY SSR: SERIYA FIZIKO- MATEMATICHESKAYA, No 5(132), Sep-Oct 86).....	63
Pressure and Mass Velocity Measurements in Solids Subjected to Dynamic Loadings (P. A. Urtiew, R. M. Erikson, et al.; FIZIKA GORENIYA I VZRYVA, No 5, Sep-Oct 86).....	64
Multiply Charged Particles in Primary Cosmic Rays With Energy $\geq 2$ TeV (I. P. Ivanenko, N. L. Grigorov, et al.; PISMA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI, No 4, 25 Aug 86).....	66
Explosive Absorption of Laser Beam of Finite Diameter (A. N. Orayevskiy, I. Ye. Protsenko; KVANTOVAYA ELEKTRONIKA, No 7, Jul 86).....	67
Study of Resonance Electron Tunneling Under Scanning Electron-Tunneling Microscope (M. Yu. Sumetskiy; PISMA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI, No 6, 25 Sep 86).....	68
Anomalous Thermal Diffusivity and Conductivity of V, Nb, Ta Near Melting Point (V. Ye. Zinovyev, V. F. Polev, et al.; FIZIKA TVERDOGO TELA, No 9, Sep 86).....	68

#### THEORETICAL PHYSICS

Two-Photon Absorption of Ions in a Two-Dimensional Closed Trap (V. A. Ulybin, V. P. Chebotayev; OPTIKA I SPEKTROSKOPIYA, No 2, Aug 86).....	70
Influence of Permanent Magnetic Field on Relaxation Characteristics of an Atom in a Resonant Field of Radiation (T. Ya. Karagodova; OPTIKA I SPEKTROSKOPIYA, No 3, Sep 86)...	71

Theoretical Calculation of Einstein Coefficients of New Vibrational Transitions in CO <sub>2</sub> Molecule (S. M. Zavoruyev, V. A. Pivovarov, et al.; OPTIKA I SPEKTROSKOPIYA, No 3, Sep 86).....	71
Channelling of Ultrarelativistic Electrons: Does This Phenomenon Exist? (V. A. Bazylev, V. I. Glebov, et al.; DOKLADY AKADEMII NAUK SSSR, No 1, 1986).....	72
Studies of Monopolistic Excited States of <sup>12</sup> C Nucleus in 3 Alpha-Particle (R. I. Dzhibuti, T. Ya. Mikhelashvili, et al.; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 10, Oct 86)...	73
Coherent Emission of High-Energy Photons and Pi-Mesons in Reactions With Heavy Ions (I. S. Batkin, I. V. Kopytin; IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA, No 10, Oct 86).....	74

POLARIZED LUMINESCENCE IN THE VISIBLE AND INFRARED AREAS OF THE SPECTRUM  
OF COLOR CENTERS IN  $\alpha\text{-Al}_2\text{O}_3$

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian Vol 61, No 2, Aug 86  
(manuscript received 3 Feb 86) pp 338-341 (Cat. 10)

[Article by Ye. F. Martynovich, A. G. Tokharev and S. A. Zilov]

[Abstract] A detailed study is presented of the optical properties of a color center responsible for generation of radiation with absorption and luminescence bands with maxima at 830 and 980 nm, respectively. The orientation of moments of transition in the nonphonon line and phonon limbs are determined, serving as a basis for determination of the type of electron-phonon interaction. The relationship of optical electrons to lattice oscillations of the color centers is described in the Frank-Condon approximation. Experiments were performed on specimens of  $\alpha\text{-Al}_2\text{O}_3$  single crystals grown by the method of horizontal directed crystallization, bombarded with reactor radiation and heat treated at 800 K. The specimens were prepared in cubic form with polished faces and  $C_{3v}$  optical axis of the crystal directed perpendicular to two opposite faces. The experiments determined the polarization relationships and computed the angles of orientation of electro-dipole moments of transitions for color centers in leukosapphire luminescing in the visible and infrared areas. Figures 4, references 7: 6 Russian, 1 Western.

## STUDY OF THERMOLUMINESCENCE OF YTTRIUM-ALUMINUM-GARNET CRYSTALS DOPED WITH NEODYMIUM NEODYMIUM

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian Vol 61, No 3, Sep 86  
(manuscript received 27 Jan 86) pp 537-541 (Cat. 10)

[Article by V. M. Garmash, G. A. Yermakov, V. M. Lyubchenko and A. A. Filimonov]

[Abstract] Results are presented from studies of the spectral variation of thermoluminescence in YAG and YAG-Nd<sup>3+</sup> crystals as well as results of determination of changes in integral thermoluminescence curves upon selective luminescence of capture centers. The studies were performed on pure and Nd-doped (1 at.%) YAG crystals grown in an inert atmosphere. Thermoluminescence experiments were performed in the 77-300 K temperature area. The studies showed that the process of thermoluminescence in YAG crystals depends on doping. In pure crystals at T<150 K, thermoluminescence is related to radiative breakdown of autolocalized excitons, while at T>150 K it is related to recombination of charge carriers on structural defects. Doping of YAG crystals with neodymium leads to localization holes in the oxygen vicinity of neodymium ions and the appearance of characteristic radiation of Nd<sup>3+</sup> ions with  ${}^2F_{5/2}$  at the lowest levels. Peaks of 190 and 210 K apparently result from an iron impurity. Figures 4, references 12: 5 Russian, 7 Western.

UDC 539.184:546.76-128:548.0

HIGH ENERGY LEVELS OF THE Cr<sup>3+</sup> ION IN Y<sub>3</sub>Al<sub>5</sub>O<sub>12</sub>

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian Vol 61, No 3, Sep 86  
(manuscript received 16 Dec 85) pp 639-643 (Cat. 9)

[Article by I. S. Gorban, A. F. Gumenyuk and V. Ya. Degoda]

[Abstract] Results are presented from a study of the absorption spectra, luminescence excitation spectra, photoluminescence and its attenuation in YAG-Cr<sup>3+</sup> crystals at temperatures of 85, 293 and 550 K. Studies were performed on single crystal specimens with no optical impurities. Absorption spectra were studied by the method of two thicknesses in the 200-400 nm area. Absorption maxima related to the  ${}^4A_2 \rightarrow {}^4T_1$  transition were observed at all temperatures. More reliable information on the observed chromium impurity bands can be obtained from luminescence excitation spectra. Positions of the bands in absorption and luminescence excitation spectra correspond well, the differences in their intensities being explained by different

quantum yield of luminescence upon excitation in the individual absorption bands. Comparative analysis of the two types of spectra indicates the absorption bands, which agree satisfactorily with the calculated positions of  $\text{Cr}^{3+}$  levels in YAG. Figures 2, references 9: 4 Russian, 5 Western.

#### EPR OF $\text{Mn}^{2+}$ - CENTERS IN REGULAR ENVIRONMENT IN A KCl CRYSTAL

Leningrad FIZIKA TVERDOGO TELA in Russian, Vol 28, No 8, Aug 86  
(manuscript received 28 Jan 86) pp 2529-2531 (Cat. 2)

[Article by A. G. Badalyan, M. M. Petrosyan and V. A. Khramtsov, Physical-Technical Institute, imeni A. F. Ioffe, USSR Academy of Sciences, Leningrad]

[Abstract] A report is presented of observation of  $\text{Mn}^{2+}$  ions in a regular environment in a KCl crystal. The crystal was exposed to x-rays to create  $\text{Mn}^+$  ions in the regular environment, then optically irradiated in the absorption band of  $\text{Mn}^+$  ions, causing them to be ionized to form the  $\text{Mn}^{2+}$  ions. The EPR signal from the  $\text{Mn}^+$  ions decreased at this point, with a new isotropic spectrum of  $\text{Mn}^{2+}$  ions appearing, its isotropic nature confirming the regularity of the environment of the  $\text{Mn}^{2+}$  ions. Figures 1, references 5: 3 Russian, 2 Western.

ABSORPTION OF ACOUSTIC WAVES IN  $\text{Bi}_4\text{Ge}_3\text{O}_{12}$  CRYSTALS

Leningrad FIZIKA TVERDOGO TELA in Russian Vol 13, No 6, Jun 86 (manuscript received 25 Jul 85, after final rework 6 Dec 85) pp 1950-1953

[Article by S.N. Ivanov, V.F. Kargin, Yu.F. Kargin, I.M. Motelyanskiy, V.M. Skorikov, V.V. Medved and A.V. Khomich, Radio Engineering and Radio Electronics Institute, USSR Academy of Sciences, Moscow]

[Abstract] Data on AV [acoustic waves] absorption in  $\text{Bi}_4\text{Ge}_3\text{O}_{12}$  were obtained. Specimens were prepared from crystals that were grown, using Chokhralskiy method, in platinum crucibles, with radiation or high-frequency heating, had 4 x 4 x 8 mm dimensions and were oriented along a  $\langle 110 \rangle$  or  $\langle 100 \rangle$  crystallographic axis. Faces of the specimens were polished according to optical standards. Excitation and reception of longitudinal and transverse AV were accomplished with the help of texturized zinc oxyde films. AV absorption was measured at frequencies of 0.5-9.4 GHz in the 4.2-300 K temperature range, using pulse echo-method, by a large number of pulses with controlled exponentiality of their decay. Dependences of absorption of longitudinal AV on temperature and frequency were determined. These dependences were different for different temperature ranges: under 30 K, 30-60 K and over 100 K. In the first range, strong temperature dependence and the absence of frequency dependence was observed. In the third range, temperature absorption dependences were flattening, whereas frequency dependence was linear, which corresponds to AV absorption according to Akhiezer mechanism. In the second range, excessive AV absorption was observed. Temperature status of the excessive AV absorption indicated its relaxation character, due to interaction between the wave and a defect in the crystal. In order to determine the nature of the observed defect, infrared transmission spectra of this group of crystals were examined. The conducted experiments made it possible to assume that hydroxide groups OH constituted the defect that caused the excessive relaxation absorption in  $\text{Bi}_4\text{Ge}_3\text{O}_{12}$ . Thus, excessive AV absorption peaks, observed in  $\text{Bi}_4\text{Ge}_3\text{O}_{12}$ , were caused by relaxation interaction of the wave with OH groups, having energy-nonequivalent orientations. The interaction mechanism consists of reorientation of OH groups with participation of thermal phonons with respective energy. Obtained values of AV absorption in  $\text{Bi}_4\text{Ge}_3\text{O}_{12}$  crystals indicate rather high acoustic quality of these crystals and the possibility of using them in acoustoelectronic devices. Figures 3, references 8: 3 Russian, 5 Western.

## ON MAGNETOOPTICAL ANISOTROPY OF RARE-EARTH CRYSTALS

Leningrad FIZIKA TVERDOGO TELA in Russian Vol 13, No 6, Jun 86 (manuscript received 4 Jun 85, after final rework 28 Nov 85) pp 1760-1767

[Article by A.K. Zvezdin, A.I. Popov and Kh.I. Turkmenov]

[Abstract] The work solves the problem of relation between magnetooptical and magnetic properties of crystals of rare earth [RZ] compounds in the case of quadratic effects. Components of the tensor of polarizability of an RZ ion in a crystal field were calculated. Field dependence and anisotropy of magnetic birefringence are discussed. Three types of the main state of an RZ ion were examined: a singlet, a Kramers doublet and a quasi-doublet. The examination was limited to low temperatures, when it was sufficient to take into account thermal population of only those levels of the RZ ion that belong to the main state. The singlet main state is realized, for instance, for ions of  $Tm^{3+}$ ,  $Pr^{3+}$  in RZ garnets and  $Eu^{3+}$ . The Kramers doublet main state is realized for Kramers RZ ions, located in low-symmetrical points of the lattice and for  $\gamma_2$ -cubic symmetry levels. The quasi-doublet main state is realized, for instance, for ions of  $Tb^{3+}$  and  $Ho^{3+}$  in RZ garnets and orthoferrites. 1 figure, 15 references: 9 Russian, 6 Western.

MONTE-CARLO SIMULATION OF  $\text{Yb}^{3+}$  OPTICAL CENTERS IN SILICATE GLASS

Leningrad FIZIKA TVERDOGO TELA in Russian Vol 13, № 6, Jun 86 (manuscript received 25 Nov 85) pp 1753-1759

[Article by A.P. Zenkov and A.K. Przhhevskiy, Leningrad Pedagogic Institute imeni A.I. Gertsen]

[Abstract] A Monte-Carlo statistic model of silicate glass, activated by  $\text{Yb}^{3+}$  ions, was examined. In constructing the model, no initial assumptions on configurations of ligands were made, as these configurations come out automatically and have a stochastic character. The algorithm worked as follows. The main portion of calculations were conducted on a model, comprised of 18  $\text{Si}_4^{+}$ , 9  $\text{Na}^{+}$ , 1  $\text{Yb}^{3+}$  and 42  $\text{O}^{2-}$  ions. In addition, models with a similar composition, but one order of magnitude larger were examined. In a cube with dimensions, determined by density of simulated glass, points, symbolizing atoms, were thrown at random. Energy  $E$  of the resulting configuration was calculated under the assumption that interaction of the pair of atoms  $i$  and  $j$  was described by potential of the Born-Mayer type. The main portion of the algorithm was comprised of model relaxation, directed at getting atom configuration that could be considered a canonic ensemble element at temperature  $T$ . The relaxation was accomplished in the form of successive atom shifts, one at a time. Each time, the change of configuration energy, caused by a possible trial shift of one of the atoms by a vector with three random numbers as coordinates, was calculated. Calculated from the model value of energy, required for dividing the configuration into ions with charges, equal to formal ones (lattice energy), was close to the value (2250 kcal/mol), determined, using the additive principle, from experimental data on oxides. The ytterbium centers model had a purely statistic character. For each ytterbium center of the model, Stark splittings of levels were calculated and energy of optical transitions from lower Stark components were determined. Calculations of  $\text{Yb}^{3+}$  spectra in this work, as well as calculations of  $\text{Eu}^{3+}$  spectra, performed earlier by C. Brecher and L.A. Riseberg, and results, obtained in the case of using models, based on the most dense non-ordered packing of balls, bring one to a conclusion that spectra of doped RZE [rare-earth elements] glasses can be satisfactorily interpreted, based on the idea that there are a large number of geometric configurations of centers, characterized by a set of RZE coordination numbers. In silicate glasses, each oxygen ion of RZE polyhedron must be a part of at least one other polyhedron of a modifier cation (not silicon). These cations must be taken into

consideration, when explaining properties, using the model. Figures 4, references 17: 4 Russian, 13 Western.

RAMAN SPECTRA AND HIGH TEMPERATURE FERROELECTRIC PHASE TRANSITION IN  
 $\text{LiN}(\text{H}_x\text{D}_{1-x})_4\text{SO}_4$

Leningrad FIZIKA TVERDOGO TELA in Russian Vol 13, No 6, Jun 86 (manuscript received 24 Oct 85) pp 1675-1682

[Article by V.I. Torgashov, Yu.I. Yuzyuk, F. Smutnyy and M. Polonska, Physics NII [Scientific Research Institute], Rostov-on-Don State University]

[Abstract] Raman spectra of partially deuterated IAS [ $\text{LiN}(\text{H}_x\text{D}_{1-x})_4\text{SO}_4$ ] (called D'IAS thereafter) in two phases, I and II, were studied, in order to identify microscopic causes of phase transitions [FP] in this crystal. IAS deuteration does not cause any significant qualitative changes of IAS properties, with the exception of small (by 2 to 3 degrees) shifts of transition temperatures. However, it helps interpret modes of ammonia ions. Colorless D'IAS monocrystals were grown, using evaporation method, at 303 K. Usually, specimens are sector-twinned. Crystals were cut out from individual sectors, in order to obtain non-twinned specimens. Raman spectra were excited by polarized radiation of argon laser IIA-120 and were registered by spectrometer DFS-24. For temperature measurements, crystals were placed into an optical cell, where temperature was stabilized at + or - 0.5 degree. Factor-group analysis of spectra was performed. Temperature dependencies of spectra were measured in the  $288 < T < 493$  K range and in the  $300\text{--}500\text{ cm}^{-1}$  region. The results definitely point out the fact that dynamics of the Li-SO<sub>4</sub> frame of D'IAS is related appreciably to the I - II phase transition. The microscopic cause of the I - II phase transition in IAS (D'IAS) can be the changing character of Li - O interactions, which leads to appreciable increase of swing amplitudes of sulfate ions. IAS can be a good example of a non-rigid crystal. Figures 4, references 23: 8 Russian, 15 Western.

$F_4^+$  - CENTERS IN Li-F CRYSTALS

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Apr 86  
(manuscript received 9 Jan 85) pp 677-679

[Article by L.I. Shchepina, Z.I. Myreyeva, Ye.I. Shuralyova, B.D. Lobanov and N.T. Maksimova]

[Abstract] The nature of centers, responsible for a 525 nm band in absorption spectrum, obtained by annealing gamma-irradiated LiF crystals, was examined. LiF crystals, grown in vacuum or in the air, that basically contained  $OH^-$  or  $Mg^{2+}$  ions, were studied. Optical decolorization was effected by nitrogen laser (LGI-21, 337 nm) radiation. Optical absorption spectra were measured with a computerized spectral complex KSVU-23. The crystals were irradiated by  $Co^{60}$  gamma-radiation. Exposure dose was equal to  $10^7$ - $10^9$  R. The crystals were additionally irradiated by X-radiation in an URS-55 unit. Experiments on thermal annealing, optical decolorization and transformation of color centers (TsO) were conducted. In the 160-280 °C temperature range, effective failure of  $F_3^+$  -, as well as  $F_2^+$  - and F - centers was observed. Preliminary experimental results had demonstrated that next to a zero-phonon line of the  $N_1$ -center the 522.2 nm line in the absorption spectrum was resolved and that its intensity increased, as the time of irradiation by X-radiation increased. These experimental results and the fact that after additional radiation at -170 °C intensity of  $N_1$  - (512 nm) and  $N_2$  - bands decreased led to the assumption that after heating beyond the vacancies localization temperature transformation of TsO takes place. Experiments on optical decolorization of TsO confirmed the assumption that lattice defects, namely  $F_4^+$  centers, were responsible for 525 nm centers. Thus, it was demonstrated that as a result of heat treatment,  $F_4^+$  centers, manifested in optical absorption spectra at 525 nm, had formed in LiF crystals. Figures 2, references 4: 1 Russian, 3 Western.

## POLYMER LASER ELEMENTS WITH ARENONIUM ACTIVE CENTERS

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Apr 86  
(manuscript received 9 Jan 85) pp 675-677

[Article by A.Ya. Gorelenko, I.I. Kalosha and V.A. Tolkachov]

[Abstract] Methods for creating lasing capable active molecular centers in a polymer matrix that are initiated by specific physicochemical interactions, for instance, ion interactions, were developed. It was found that arenonium ions, which are positively charged proton-bound complexes, are also created by adding sulfuric acid to solutions of polycyclic ketones in methyl acrylate. It was demonstrated that with acid content of the order of 8% and higher, active centers form that absorb almost 120 nm further into the long-wave band, i.e. arenonium ions. Increased acid concentration lowered intensity of short-wave fluorescence (510 nm), and, beginning at 25%, only fluorescence of arenonium ions was observed. Laser polymer elements were prepared that contained arenonium active centers and 25-40% of sulfuric acid. The elements were produced by thermal polymerization under thermostatic conditions of polycyclic aromatic ketone solution in a mixture of methyl acrylate, sulfuric acid and an AIBN initiator in the form of 3 mm thick plates, clamped between two sheets of polished glass. These elements were studied within the longitudinal pumping arrangement. Spectrum generation characteristics of active media, based on arenonium ions of benzathrones in polymethyl acrylate, were obtained. An attempt to create generationally capable active media, based on polymethyl acrylate, doped by a form of aromatic ketones, photoreduced in the excited state, was unsuccessful. Generation in the photoreduced form was observed up to the transformation degree of 60%. It was proved that active laser media, based on polymer matrices with arenonium ions as working centers, are possible. Figure 1, references: 11 Russian.

GENERATION OF  $\text{Al}_2\text{O}_3:\text{Ti}^{3+}$  CRYSTALS IN CONTINUOUS AND QUASI-CONTINUOUS MODE

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Oct 86  
(manuscript received 15 Apr 86) pp 567-573

[Article by G.S. Kruglik, G.A. Skripko, A.P. Shakadarevich, N.V. Kondratyuk,  
V.S. Urbanovich and P.N. Nazarenko]

[Abstract] Studies were conducted of generation characteristics of lasers, based on  $\text{Al}_2\text{O}_3:\text{Ti}^{3+}$  crystals, excited by an  $\text{YAG}:\text{Nd}^{3+}$  based laser with intracavity frequency doubling that operates in various modes, as well as by an argon laser. Energy, space and time characteristics were measured for three types of nonselective resonators: plane-parallel, quasifocal and a resonator with an internal focusing element. Spectral generation characteristics were studied in both selective and nonselective resonators, using crystals with resonance structures, different in space period and contrast. The use of a resonator with an internal focusing element made it possible to considerably increase radiation brightness. In the experiments, lasing was accomplished with absorbed energy threshold per pulse  $< 1$  microjoule, which at pulse repetition frequency of 25 kHz was equivalent to average power  $< 25$  mW. In all cases, generation radiation was linearly polarized, wherein orientation of generation radiation polarization plane did not depend on that of pumping radiation. In the case of quasicontinuous excitation, generation had a spike character. In the case of continuous excitation, induced by an argon laser, generation generally had a chaotic spike character. Spectral generation characteristics of  $\text{Al}_2\text{O}_3:\text{Ti}^{3+}$  crystals are different for different modes. Spectra in cases of pulse and quasicontinuous excitation are the richest detailwise. Generation spectrum can be controlled, using interference-polarization properties of active  $\text{Al}_2\text{O}_3:\text{Ti}^{3+}$  crystals. It was demonstrated that generation spectrum had at least triple modulation. With quasicontinuous lasing on an  $\text{Al}_2\text{O}_3:\text{Ti}^{3+}$  crystal, wavelength rearrangement can be accomplished in the 675-950 nm range that can be expanded by using different mirrors. Generation pulse length and time delay thereof, compared to an excitation pulse at constant pumping power, had the minimum value at the maximum of the rearrangement curve and increased at the range boundaries. These features were characteristic of both pulse and quasicontinuous excitation and must be taken into account in using rearrangeable lasers, based on  $\text{Al}_2\text{O}_3:\text{Ti}^{3+}$ , in experiments, as well as in various nonlinear transformations. Figures 5, references 12: 8 Russian, 4 Western.

## RELATION BETWEEN FORMATION OF UNSTABLE COLOR CENTERS IN LASER CRYSTALS AND EMISSION CHARACTERISTICS OF SUCH CRYSTALS

Minsk ZHRUNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 45, No 2, Aug 86  
(manuscript received 11 Jan 85, after completion 27 Feb 86) pp 205-210

[Article by L. G. Karaseva, N. Yu. Konstantinov, V. V. Gromov, A. P. Kalagin, V. K. Novikov, V. N. Nikolayev and V. M. Sorokin]

[Abstract] An experimental study of unstable color centers in crystals of YA (yttrium aluminate)+  $\text{Nd}^{3+}$ , YAG (yttrium-aluminum garnet)+  $\text{Nd}^{3+}$ , KGT (potassium-gadolinium tungstate)+  $\text{Nd}^{3+}$ , and GSGG (gallium-scandium-gadolinium garnet)+  $\text{Nd}^{3+}$ +  $\text{Cr}^{3+}$  (stabilizer) was made, for the purpose of determining the dependence of their formation efficiency on filtering of the optical pumping radiation and determining the relation between their concentration and the emission characteristics of these crystals. The optical pumping radiation was passed through BS, ZnS, OS, KS, IKS ladder light filters, with the wavelength corresponding to 50% transmission arbitrarily but accurately regarded as the filtration limit. The lifetime of unstable color centers was known to vary depending on the crystal material, being shortest in KGT crystals and longest in GSGG crystals. Measurements with a modified KSF-176 spectrophotometer have yielded the absorption spectra of unstable color centers in these crystals as well as the dependence of the relative change in the absorption coefficient at the wavelength corresponding to maximum absorption and of the relative change in the laser emission energy on the change of the filtration limit for the optical pump. The results indicate that unstable color centers in different crystals have different absorption spectra, with different widths of absorption bands and different peak wavelengths. The optimum filtration limits for all crystals were, however, found to fall within the 320-360 nm range and thus to differ not more than by 40 nm. Separate measurements made on  $\text{YAG:Nd}^{3+}$  crystals with  $\text{Fe}^{3+}$  impurity ions and with stable color centers absorbing radiation within the 350-500 nm range revealed a dependence of the laser emission energy on the  $\text{Fe}^{3+}$ -concentration. This dependence is characterized by dipping of the emission energy to a minimum at an  $\text{Fe}^{3+}$ -concentration of approximately  $5 \cdot 10^{17}$  ions/cm<sup>3</sup>, evidently owing to participation of  $\text{Fe}^{3+}$ -ions in photoreactions which produce stable hole centers which absorb visible and ultra-violet light. ## NEW ACHIEVEMENTS IN CRYSTAL SCIENCE

Moscow VESTNIK AKADEMII NAUK SSSR in Russian No 9, Sep 86 pp 38-53

[Article by Academician B. K. Vaynshteyn]

[Abstract] Recent developments in crystal science include new discoveries about the atomic structure of crystals formed by inorganic and organic substances, about topography of real crystals deviating from ideal ones, about phase transitions in crystals such as ferroelectric and paraelectric ones, about physical properties of crystals such as piezoelectric and pyroelectric as well as ferroelectric ones, discovery of solid electrolytes with superionic conductivity (phosphate salts) and photorefractive crystals complementing  $\text{LiNbO}_3$ , synthesis of new laser crystals complementing the classical  $\text{Al}_2\text{O}_3 + \text{Cr}^{3+}$  ruby such as  $\text{Al}_2\text{O}_3 + \text{Ti}^{3+}$ ,  $\text{Y}_3\text{Al}_5\text{O}_{12} + \text{Nd}^{3+}$ , rhombic  $\text{YAlO}_3 + \text{Nd}^{3+}$ ,  $\text{BeAl}_2\text{O}_4 + \text{Cr}^{3+}$ , compression of alkali-halide crystals ( $\text{CsI}$ ), and crystallization of inert gases ( $\text{Xe}$ ). These developments were made possible respectively by high-precision x-ray diffractometry, high-resolution electron-microscopy, one-crystal as well as two-crystal and three-crystal interferometry, standing-wave x-radiography, and new apparatus for both laboratory and industrial crystal growing based on better knowledge of the crystal seeding process. ## GROWING HETEROEPITAXIAL Ge LAYERS ON GaAs SUBSTRATE FROM COOLED SOLID SOLUTION

Moscow POVERKHNOST: FIZIKA, KHIMIYA, MEKhanIKA in Russian No 10, Oct 86 (manuscript received 19 Sep 85) pp 148-151

[Article by N. P. Yurchenko and G. I. Bagalin, Kiev State University]

[Abstract] The feasibility of growing heteroepitaxial Ge layers on GaAs substrate from a solid solution by cooling the latter was studied experimentally, with the eutectic Ge-Al system as basis. This system has been chosen over other eutectic systems (Ge-Zn, Ge-Sb, Ge-Ag, Ge-Au), because it forms an  $\alpha$ -phase solid solution (Ge-Zn does not), also because Al does not sublime (Sb does) and maintains a stable interface with GaAs (more electronegative Ag and Au do not). Epitaxial GaAs substrates with (111)A and (100) orientations were first cleaned chemically for removal of oxide and then further purified by heat treatment at 773 K under vacuum for 10 min. With the substrates at a temperature of 473 K, 2  $\mu\text{m}$  thick Al films were deposited on them by the electron-beam method under a vacuum of  $2 \cdot 10^{-4}$  Pa. The resulting GaAs-Al structures were heat treated at 573 K for 30 min, for final purification of the substrate-metal interface. On the Al films were then deposited Ge layers, their thickness  $h$  having been determined

on the basis of the relation  $h_{\text{Ge}} = l_s m_{\text{Al}} M_{\text{Ge}} \rho_s / M_{\text{Si}} \rho_{\text{Ge}}$  ( $l_s$  - thickness of solid solution,  $m_{\text{Al}}$  - molar fraction of dissolved Al,  $M$  - molecular weight of Ge and of solid solution,  $\rho$  - density of Ge and of solid solution at  $T = 673$  K temperature): 50 nm for a 2  $\mu\text{m}$  thick layer of solid solution. The solid solution was formed at 673 K, the temperature limit of GaAs-Al interface stability, and then cooled at a rate of approximately 5 K/min to room temperature. Examination of the resulting structures in a reflection electron-diffractometer as well as under scanning and transmission electron-microscopes, with replicas and with selective chemical etching, revealed imperfections in the form of Ge microtwins and stacking irregularities not found in homoepitaxial Ge layers analogously grown on Ge substrate. # PHASE PHENOMENA IN PARAMETRIC GENERATORS AND AMPLIFIERS OF ULTRASHORT LIGHT PULSES

Moscow USPEKHI FIZICHESKIKH NAUK in Russian Vol 150, No 1, Sep 86 pp 127-143

[Article by A. Piskarkas, A. Stabinis, and A. Yankauskas, Vilnyus State University imeni V. Kapsukas]

[Abstract] Progress in generation and amplification of ultrashort light pulses ranging from picosecond to femtosecond duration is reviewed, a recent development being parametric devices. Such devices, using quadratically rather than cubically nonlinear media, combine large bandwidth and high gain with wide tunability from ultraviolet to infrared wavelengths and various means of transforming both amplitude and phase characteristics of light pulses. Parametric pulse compression, first achieved by amplitude modulation with group-velocity separation of interacting light pulses, has been found to be more effective when involving phase modulation. Possible mechanisms of parametric interaction in this kind of device include conversion of quadratic phase modulation of pumping pulses by frequency chirp (linear variation of frequency) into phase modulation of emitted pulses, chirp reversal in real time, and self-compression with intense energy transfer. Theoretical feasibility of these mechanisms is supported by experiments involving principally the use of a YAG:Nd<sup>3+</sup> laser with passive mode locking and a LiNbO<sub>3</sub> crystal for second-harmonic extraction, some experiments having been performed with a La<sub>2</sub>Be<sub>2</sub>O<sub>5</sub>:Nd<sup>3+</sup> laser. Ongoing research in this area deals with use of other quadratically nonlinear high-gain wideband media such as KDP, LiIO<sub>3</sub>, CDA crystals, phase conjugation of light pulses, and control of the chirp slope. **DIMENSIONS OF IGNITION ZONES IN BLOW-OUTS OF COMBUSTIBLE GASES FROM RECTANGULAR AND CIRCULAR PORTS**

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 22, No 5, Sep-Oct 86  
(manuscript received 28 Aug 85) pp 19-22

[Article by Yu.A. Kondrashkov, V.P. Tomilin and G.G. Shevyakov, town of Balashikha]

[Abstract] A method for calculating maximum dimensions of ignition zones in blow-outs of combustible gases for axially-symmetric jets, developed by the authors earlier, is rather universal and was expanded to include cases of gas jets, effluent from rectangular and circular ports. Formulae for calculating the dimensions were derived theoretically and tested experimentally by analyzing distributions of hydrogen concentration along axes of turbulent rectangular and circular jets. The concentration was determined, using the thermoanemometry method. The length of sections, where concentration distribution corresponds to plane-parallel discharge, is different for gases with different density, effluent from rectangular ports. Therefore, it is more convenient to determine dimensions of ignition zones as the lowest dimensions, calculated according to proposed formulae; this conclusion was supported by concentration distribution in effluent jets. The obtained results make it possible to calculate dimensions of ignition zones in jet blow-outs from rectangular and circular (fan-type) ports for practically any combustible gas. Figures 2, table 1, references: 5 Russian.

## NEGATIVE ENERGY WAVES IN HYDRODYNAMICS

Moscow USPEKHI FIZICHESKIKH NAUK in Russian Vol 150, No 3, Nov 86 pp 417-437

[Article by L.A. Ostrovskiy, S.A. Rybak and L.Sh. Tsimring]

[Abstract] Some aspects of the theory of hydrodynamic stability, related to the idea of negative energy waves (VOE), are discussed. Several examples of VOE in hydrodynamics were analyzed. Statement of the problem of an elastic membrane, moving with speed  $U$  relative to homogeneous incompressible fluid it is in touch with, with the fluid occupying half-space  $Z < 0$ , was generalized by assuming that the other half-space is occupied by a compressible medium with density much lower than that of the incompressible liquid and by taking into account losses in the membrane. Gravitational-capillary waves on water surface and internal waves in a stratified liquid (such stratification is present everywhere in the ocean) were also analyzed. It was demonstrated, that wave energy is only a portion of the "true" wave energy. It was suggested that total energy is the sum of "linear" and "nonlinear" energies. Therefore, speaking of negative energy, one only means its "linear" portion, related to linearized equations, whereas the total wave energy can have, generally speaking, a different value and even a different sign. VOE related nonlinear processes were discussed, such as: explosive amplitude rise in a resonance triplet; zero energy waves as a particular case of VOE; the nonlinear stage of dissipative VOE instability; radiation instability; relative motion of two thin viscous layers of liquid. The problem of radiation instability of oscillators in hydrodynamics was solved for the general case. An assumption was made that radiation instability could be a cause of formation of soliton-type internal waves, often observed in various regions of oceans. Figures 13, references 43: 33 Russian, 10 Western.

## ON SURFACE NON-LINEAR ACOUSTIC INTERACTIONS IN FLUIDS

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 288 No 1, 1986 (manuscript received 3 Jun 85) pp 107-110

[Article by N.I. Pushkina, Moscow State University imeni M.V. Lomonosov; presented by Academician L.V. Keldysh 12 May 85]

[Abstract] Approximate equations, describing three- and four-wave interactions on the surface of a liquid, were derived. Based on these equations, a particular case, wavefront inversion [OVF] of sound by the surface was examined. The equations were derived, based on a full set of surface hydrodynamic equations of quantum mechanics, with regular liquid as a particular case. Compared to optics, the acoustic case has specific features that can only be described if acoustic properties of the medium are examined in greater detail. The derived equations correspond to following cases: three-dimensional phase modulation of sound reflection factor and amplitude modulation. By comparing these equations, a conclusion was made that the maximum contribution to the inverse wave is made by an equation, corresponding to phase modulation, when non-linear reflection takes place in, so to speak, two stages, excitation due to quadratic non-linearity of a capillary wave at low difference frequency of the reference wave and signal wave (in the case under consideration difference frequency was equal to zero) and reference wave reflection from profiled liquid surface. DEVICE FOR STUDYING THERMAL CONDUCTIVITY OF STRUCTURAL MATERIALS AT HIGH TEMPERATURES

Moscow TEPILOFIZIKA VYSOKIKH TEMPERATUR in Russian Vol 24 No 1, 1986  
(manuscript received 25 Oct 84) pp 137-143

[Article by V.E. Piletskiy and L.G. Patrusheva, High Temperatures Institute, USSR Academy of Sciences]

[Abstract] A device for absolute measurements of thermal conductivity of various substances at above the room temperatures is described. The working portion of the device is a new design of the earlier described arrangement of longitudinal heat flow with a massive heat absorber. Expressions were derived that formed an analytical basis of the method and were used for calculations of thermal conductivity and reference temperature. In order to test serviceability of the device, experiments were conducted with a specimen, made of stainless steel 12Cr18Ni10T. The derived values of coefficient of thermal conductivity are presented, They were compared to another author's results, obtained by summarizing experimental data on this steel. The maximum deviation did not exceed 3-4%. Operation of the device in the area of higher thermal conductivity values was tested, using grade MChVP of molybdenum with mass purity, equal to or better than 99.9%. Deviation of experimental data from calculated ones did not exceed 3-4%. Figures 5, tables 2, references: 5 Russian.

## INSTRUMENTATION FOR STUDYING REFLECTIVITY RATIO OF PARTIALLY TRANSPARENT MATERIALS AT EXTREMELY HIGH TEMPERATURES

Moscow TEPILOFIZIKA VYSOKIKH TEMPERATUR in Russian Vol 24 No 1, 1986  
(manuscript received 11 Nov 84) pp 125-130

[Article by S.V. Krayushkin, A.F. Parfenovich, V.A. Petrov, D.Ya. Svet and A.P. Chernyshov, High Temperatures Institute, USSR Academy of Sciences]

[Abstract] Experimental procedure and instrumentation for determining reflectivity of partially transparent refractory materials, based on oxides of aluminum, magnesium, zirconium, hafnium, silicon, yttrium and compositions and compounds thereof is described. A  $\text{CO}_2$ -laser was used as a heating source. The procedure provided for measuring reflectivity and surface temperature both in the course of heating and in a quazi steady-state of melting ablation. Special fast-response recording and measuring instrumentation was developed. The method for measuring directionally-directed reflectivity ratio for discrete wavelengths, determined by probing laser emission, was reduced to comparing energy, reflected by a specimen under investigation and a reference specimen. The latter was made of diffusely reflecting ceramics  $\text{SiO}_2$  or  $\text{Al}_2\text{O}_3$ . IG-126 lasers at wavelengths 0.63, 1.15 and 3.39 micrometers, IG-106 M-1 lasers at wavelengths 0.488 and 0.514 micrometers and a IG-70 laser at wavelength 0.44 micrometers were used as probing lasers. As emission receivers, germanium and silicon photodiodes and a Ge: Au photoresistor were used. Pyrometry was conducted in the visible and near ultraviolet spectrum. Control of the experiment and data acquisition and processing were conducted with the help of a measuring and computing complex, based on an SM-4 computer and KAMAK instrumentation. Temperature dependence of reflectivity will be analyzed in the next article. Figures 5; references: 4 Russian.

TIME CHARACTERISTICS OF TRAVELLING WAVE LASING WITH TWO-PHOTON PICOSECOND OPTICAL PUMPING

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 9, Sep 86  
(manuscript received 21 Jun 85) pp 1848-1858 (Cat. 6)

[Article by V. I. Prokhorenko and Ye. A. Tikhonov, Institute of Physics, Ukrainian Academy of Sciences, Kiev]

[Abstract] An experimental study is presented of the dynamics of formation of a generated pulse in a travelling-wave laser, indicating that the pulse length decreases monotonically with increasing pumping intensity. The maximum compression achieved was by a factor of approximately 6, the minimum pulse length of 5 ps achieved at a pumping pulse length of 31 ps. Experimental and calculated values agree approximately up to ten times the pumping threshold for a two-zone energy model of the dye used in the laser with short oscillation relaxation time. At greater excitation, the pulse breaks up into two generated pulses, which can be explained by a four-zone energy model. The compression of the generated pulse is found to be independent of pumping pulse length, the maximum degree of compression which can be achieved being determined by the pumping intensity and threshold generation. Figures 6, references 13: 6 Russian, 7 Western.

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 9, Sep 86  
(manuscript received 17 Oct 85) pp 1815-1819 (Cat. 6)

[Article by B. N. Korvatovskiy, V. V. Gorokhov, S. L. Logunov and V. Z. Pashchenko, Moscow State University, imeni M. V. Lomonosova]

[Abstract] Picosecond absorption spectroscopy requires measurement of changes in the absorption of light in a specimen studied, induced by an exciting light pulse. With very rapid relaxation, the signal recorded depends not only on the amplitude, but also on the time profile of the pulses, so that fluctuations in pulse length contribute to measurement error. A method is suggested for monitoring the relative change in picosecond pulse length and selecting pulses within a predetermined length range based on generation of a second harmonic. Length selection of pulses in a spectrometer increases the accuracy of recording of spectrometric curves and improves the time resolution of the method. The statistical parameters of picosecond spectrometer light pulses were measured, demonstrating the possibility of decreasing measurement error by selection of pulses by length. # DYNAMIC RESTRUCTURING OF PULSED CO<sub>2</sub> LASER FREQUENCY AND MULTIPLE-PEAK GENERATION IN A CELL WITH IR-ABSORBING GAS IN THE RESONATOR

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 9, Sep 86  
(manuscript received 23 Jul 85) pp 1801-1807 (Cat. 6)

[Article by G. N. Makarov, Institute of Spectroscopy, USSR Academy of Sciences, Troitsk, Moscow Oblast]

[Abstract] There are several methods of producing multiple-frequency radiation in pulsed atmospheric pressure CO<sub>2</sub> lasers operating in the nanosecond band. This article suggests a new method, consisting in that the frequency of the laser is dynamically tuned from one line to another by means of a cell with an IR-absorbing gas within the cavity of the resonator. The method allows production of a series of pulses at decreasing frequencies, generation on several lines simultaneously, as well as production of a train of pulses at the same frequency. Dynamic tuning, multiple-frequency and multiple-peak generation are achieved by the fact that the IR-absorbing gas is placed in the cavity, the spectrum of linear absorption of the gas being in the direction of blue from the laser generating frequency by about 5 to 50 cm<sup>-1</sup>,

depending on the steepness of the low-frequency limb, and the spectrum of absorption of the molecules shifts in the red direction by oscillation excitation. This allows rapid scanning, simultaneous generation at 2 to 5 frequencies, as well as trains of 8 to 10 pulses at the same frequency. Figures 6, references 25: 8 Russian, 17 Western.

#### CAUSES AND DISTRIBUTION OF FAILURES IN SEMICONDUCTOR LASERS (A REVIEW)

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 9, Sep 86  
(manuscript received 25 Feb 86) pp 1749-1769 (Cat 6)

[Article by P. G. Yelisseyev, Institute of Physics, imeni P. N. Lebedev,  
USSR Academy of Sciences, Moscow]

[Abstract] A discussion is presented of the causes of failures in semiconductor lasers based on a review of the (primarily Western) literature. Reliability characteristics are defined and a review of failure statistics is presented. The question of predicting the operating life and techniques for selection of lasers during quality control are studied. This study of the phenomenological aspect of the problem of reliability and durability of semiconductor lasers as reflected in the literature does not cover problems of the physics of failures. A model of failures is suggested in which the failure parameter is described by a normal distribution, while failure statistics correspond to a log-normal distribution. Injection lasers have achieved operating lives of  $10^5$  hours or more, thus approaching the levels of the most durable semiconductor electronic devices. Figures 7, references 49: 10 Russian, 39 Western.

STUDY OF VIBRATION RELAXATION IN ACTIVE MEDIUM OF CO<sub>2</sub>-LASER USING PHASE-ABSORPTION METHOD

Minsk ZHURNAL PRIKLADNOY SPEKTROSCOPII in Russian Vol 44, No 3, Mar 86  
(manuscript received 26 Sep 84) pp 381-388

[Article by B.F. Kuntsevich, A.N. Pisarchik and V.V. Churakov]

[Abstract] A modification of a phase-absorption method, proposed in an earlier work, was tested, as it applied to studies of the rate of decay of energy, stored in the active medium of CO<sub>2</sub>-lasers. The essence of the method was as follows. Current density of discharge, exciting a gas mixture, is modulated with certain frequency. Populations of CO<sub>2</sub> vibration levels will change with the same frequency. The change of populations is controlled, using weak probing radiation, which is resonant, for instance, with the transition between levels 10<sup>0</sup>0 and 00<sup>0</sup>1. In this case, an unknown constant is determined from the value of experimentally recorded phase shift between periodic oscillations of current and intensity of probing radiation. Relations that make it possible to find unknown parameters from experimentally measured phase shift were derived. Limiting cases were examined theoretically; they can be easily realized experimentally by appropriate selection of active medium composition and pressure, pumping current and working medium pumping speed. Analysis of experimental results of measuring phase shift as a function of discharge current modulation frequency for three different gas mixtures (CO<sub>2</sub>:N<sub>2</sub>:He = 1:3:10, 1:1:5 and 3:1:10) demonstrated that they agreed qualitatively with the theoretical expression, with the exception of the low frequency area (not exceeding 200 Hz). Similar experiments were also conducted for mixtures, where 80% of <sup>12</sup>CO<sub>2</sub> was replaced by the <sup>13</sup>CO<sub>2</sub> isotope. For a mixture, containing the isotope, the ratio of effective relaxation rate to gas mixture pressure is approximately 40% higher than for a regular mixture. This demonstrates faster collisional deactivation of effective energy for the <sup>13</sup>C<sup>16</sup>O<sub>2</sub> molecule, compared to <sup>12</sup>C<sup>16</sup>O<sub>2</sub> molecule. This fact should be taken into account, when developing laser systems that would use this molecule and operate in a continuous or quasi-continuous mode. The speed of resonance exchange between CO<sub>2</sub> and N<sub>2</sub> was in good agreement with available literature data. The proposed method complements already known methods and has certain advantages. For more purposeful application of the method it is desirable to control simultaneously active medium parameters. Figures 3, references 17: 15 Russian, 2 Western.

## TEA-TE: POWERFUL NITROGEN-BASED LASER SYSTEM

Minsk ZHURNAL PRIKLAADNOY SPECTROSCOPII in Russian Vol 44, No 3, Mar 86  
(manuscript received 16 Apr 85) pp 509-511

[Article by Yu.V. Zvinevich, I.N. Kazimirchik, N.A. Nemkovich, A.N. Rubinov  
and V.I. Tomin, Physics Institute, Belorussian SSR Academy of Sciences, Minsk]

[Abstract] The existing need for affordable and reliable light excitation sources with pulse lengths of less than 1 ns, generating light pulses in a required spectrum, can be rather simply met with the help of nitrogen molecular lasers. An efficient TEA-TE nitrogen-based system with short generation pulse, designed mainly for kinetic spectroscopy studies, was developed. In the system, a reliable permanent synchronization of the generator and the amplifier was achieved. Dependence of output radiation energy of the entire laser system on the energy of generator radiation, injected into the amplifier, was studied, and amplification factor was calculated: it was equal to  $0.25 \text{ cm}^{-1}$ . Duration of radiation, generated by the system, was equal to 1 ns in half-width. Peak generation power, calculated based on this duration, was equal to 300 kW at operating voltage of 16 kV and amplifier pressure of  $1.2 \times 10^4 \text{ Pa}$ . The system life in this case was equal to  $10^8$  flashes and was limited by electrical strength of the generator strip line. A specific feature of the amplifier-generator system is a high stability of output radiation, caused by nonlinearity of the system amplifier. Stability of radiation pulses was equal to + or - 5%. Figures 2, references 7: 3 Russian, 4 Western.

INTRACAVITY SPECTRUM ANALYZER WITH  $\text{NaF:F}_2^+:\text{F}_3^-$  CRYSTAL LASER FOR LONG-WAVE IR WAVE BAND

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Apr 86  
(manuscript received 31 Oct 84) pp 576-580

[Article by V.A. Vratskiy and A.N. Kolerov]

[Abstract] An intracavity spectrum analyzer with  $\text{NaF:F}_2^+:\text{F}_3^-$  crystal laser was used in order to widen the long-wave application boundary of VRLS [intracavity laser spectroscopy] into the IR waveband and to increase sensitivity. NaF crystals were used, with color centers [TsO] induced by gamma-irradiation by a  $^{60}\text{Co}$  source. As a pumping source of  $\text{F}_2^+$  and  $\text{F}_3^-$  TsO in the NaF crystal, a ruby laser with duration of continuous lasing of approximately 800 microseconds and energy of up to 15 J was used. A non-selective resonator provided a "smooth" IR radiation spectrum on  $\text{F}_2^+$  and  $\text{F}_3^-$  TsO. For spectral rearrangement, mirrors with reflectivity close to 100% in various spectral ranges and a prism, made of TF-1, and quartz wedges were used. The spectrum analyzer was used for gas or plasma diagnostics. Spectra of atmospheric air and water steam were studied, as the most universal spectra for the near IR waveband. A number of new lines was detected in absorption spectra of atmospheric air and carbon arc plasma flame, which meant that real sensitivity of the analyzer was at a  $(1-3) \times 10^{-8} \text{ cm}^{-1}$  level. It was not possible to calibrate the analyzer by reflectivity, because development of reference standards with optical density of the order of  $10^{-6}-10^{-8}$  is a complex problem in its own right. Using the spectrum analyzer, concentration of molecules and absorption cross-section of low-pressure water steam in a dish was assessed experimentally. Absorption spectra of complex fluorhydrocarbons were studied. It was demonstrated experimentally that the spectrum analyzer makes it possible to analyze substances both in gaseous and ionized states. Figures 2, references 7: 5 Russian, 2 Western.

## STUDY OF KINETICS OF INTRACAVITY ABSORPTION IN PULSED DYE LASERS

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Apr 86  
(manuscript received 11 Oct 84) pp 567-572

[Article by V.S. Burakov, V.A. Malashonok, S.V. Nechayev, R.A. Pupko, S.N. Raykov and S.I. Shedenkov]

[Abstract] Kinetics of intracavity absorption in dye lasers with tube pumping (length of generation pulse 3 microseconds) and with ruby laser second harmonic pumping (25 ns) was studied. Time dependence of laser generation intensity  $I$  and  $I_0$  for various values of optical density  $D$  of selective losses was studied. Water and ethanol solutions of europium nitrate were used as objects that provide selective absorption. Optical density of a specimen, introduced into the resonator, was varied by changing solution concentration or by scanning the recorded area of spectrum along the absorption band contour at a constant concentration. The analytical signal  $I$  was recorded with the help of a diffraction monochromator and photodetectors with sufficient time resolution. Experimental data were in satisfactory qualitative agreement with theoretical results. It was concluded that competition of laser modes determined to a large degree the kinetics of intracavity absorption in multimode pulsed action dye lasers with generation length not exceeding several microseconds. These conclusions were confirmed by derived experimental dependencies. The studies made it possible to reach certain conclusions in regard to choosing a method for recording the analytical signal in intracavity laser spectroscopy. The study results demonstrated a complex character of the process of intracavity absorption in pulsed dye lasers with generation length, equal to  $10^{-8}$ - $10^{-6}$  s. The use of a recording system with time resolution of a laser generation pulse makes it possible to increase the sensitivity of intracavity measurements. Figures 4, references 9: 3 Russian, 6 Western.

EFFECT OF MULTIPLICATION OF SPECTRAL COMPONENTS OF MULTI-FREQUENCY LASING  
OF PULSED TUNABLE LASER

Leningrad PISMA V ZHURNAL TEKHNIЧЕСКОГО ФИЗИКИ in Russian Vol 12, No 22, 26  
Nov 86 (manuscript received 3 Jul 86) pp 1381-1385

[Article by V.I. Kravchenko and V.V. Taranov, Physics Institute, Ukrainian SSR  
Academy of Sciences]

[Abstract] For the first time, characteristics of multi-frequency lasing developed due to simultaneous diffraction of several light beams, incident at different angles onto a common diffraction grating, which is a dispersion element of a laser resonator, were presented and discussed. The effect of the progressive increase in the number of spectral components, as the number of diffracting beams increases, wherein it is difficult to independently control these spectral components, was detected and explained. Lasing spectra of a laser, based on the 6-aminophenolenon solution, pumped by the second harmonic radiation of an YAG:Nd<sup>3+</sup> laser. Genesis of the structure of the spectrum of multi-frequency generation of a laser with a dispersion resonator is claimed to be determined. Controlling addition spectral components is an independent complex problem. It was emphasized that taking into consideration the effect of multiplication of spectral components taking into consideration the effect of multiplication of spectral components of a multi-frequency laser is necessary in developing tunable lasers and in simulating complex laser spectra for multi-frequency optical communications and correlation analysis. Figures 2, references: 6 Russian.

## CHARACTERISTICS OF LKI-501 TUNABLE DYE LASER WITH DYES IN SOLID MATRIX

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 45, No 1, Jul 86  
(manuscript received 20 Mar 85) pp 35-39

[Article by A. I. Zhiltsov, A. G. Klimashina, V. Ye. Mnuskin, V. G. Nikiforov, A. N. Tokareva, and B. F. Trinchuk]

[Abstract] An experimental study of the LKI-501 tunable dye laser was made, with dyes in a solid matrix of polymethyl methacrylate and with pumping by second-harmonic radiation from a YAG:Nd<sup>3+</sup> laser in pulses of 11 ns duration at a repetition rate of 25 Hz. Nearly longitudinal excitation at an 8°±10' angle, through a focusing lens, ensured a high conversion efficiency and a uniform absorption of pumping energy over the active volume. The resonator with an 80 mm long base was formed by two plane mirrors and a touching pair of Brewster prisms made of TF-5 glass set for a resultant refraction angle of 59°20'. Wavelength tuning of the laser emission was effected by rotation of the opaque first mirror. Five dyes were tested: rhodamine 6G, rhodamine 6G - isobutyrate, rhodamine C, oxazine 17, oxazine 1. Radiation within a line not wider than 0.8 nm and tunable over the 548-744 nm range (548-610 nm with rhodamine 6G, 681-744 nm with oxazine 1) was emitted by this LKI-501 laser. Insertion of a Fabry-Perot interferometer with a 100 μm long base and 65%-reflection mirrors into the resonator cavity made it possible to narrow the emission line down to 0.08 nm. Maximum conversion efficiency was attained with 350 kW pumping pulses, this being the saturation level. The maximum efficiency was 37% with rhodamine 6G - isobutyrate, 31.5% with rhodamine 6G, 29% with rhodamine C, 10% with oxazine 1, 3.3% with oxazine 17. The characteristics of second-harmonic radiation emission by the LKI-501 with these active media were also measured in that experiment. Figures 5; tables 2; references 10: 6 Russian, 4 Western.

## DYE LASER FOR HOLOGRAPHIC INTERFEROMETRY

Moscow KVANTONAYA ELEKTRONIKA in Russian Vol 13, No 7, Jul 86  
(manuscript received 11 May 85) pp 1386-1390

[Article by I. S. Zeylikovich, A. M. Lyalikov, and N. M. Spornik, Grodno State University]

[Abstract] A dye laser with a diffraction grating is considered for holographic interferometry. In an experimental feasibility study of such a technique, an ethanol solution of rhodamine 6G was used as the active medium, with a resonator formed by two plane mirrors at the Brewster angle to the

optical axis and a diffraction grating (1200 lines/mm) inside the cavity at an approximately 86° incidence angle in the first diffraction order. This laser was pumped by second-harmonic radiation of a ruby laser, for emission of 30 ns pulses with passive Q-switching by means of a KS19 glass plate. Second-harmonic 200 kW pumping pulses were extracted by means of a KDP crystal. Measurements were made with Zender-Mach and Michelson interferometers, auxiliary optics including a cylindrical quartz lens, an OS-12 light filter, a telescopic set of two compound lenses, two light-beam splitting cubes, two plane 45° mirrors, and an LENS, also a spectrograph for monitoring the diffraction. An analysis of space-time coherence indicates the feasibility of holographic interferometry with such a laser. A diffraction grating oriented at the grazing angle facilitates smooth tuning of the emission wavelength near the absorption line of the atomic medium in the test tube and thus makes possible resonance interferometry with sensitivity control. Such diffraction gratings also facilitate multifrequency laser emission, particularly two-frequency emission with two separate resonators and a diffraction grating inside each useful for two-wavelength holography. #### GENERATION OF LIGHT PULSES IN SEMICONDUCTOR LASER UPON EXCITATION BY SEVERAL ELECTRON BEAMS

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 7, Jul 86  
(manuscript received 16 Jul 85) pp 1336-1341

[Article by K. V. Aleksandrovich, V. V. Druzhinin, V. A. Kovalenko, and M. D. Tarasov]

[Abstract] Excitation of GaAs and CdS semiconductor lasers with several simultaneously acting fast-electron beams in proximity of one another is considered for effectively controlling the duration of generated light pulses. Experiments were performed using three different sources of high-intensity electron beams: RIUS-5 accelerator with transformer for GaAs-lasers, GTI-7 generator with IMA-8E-V cathode-ray tube and MIRA-2D commercial portable x-ray machine with IMA-3-150E cathode-ray tube for CdS lasers. The lasers were produced from single crystals of degenerate n-GaAs and plain CdS. In the GaAs specimens doped with Te and Si the donor concentration was  $N_d \approx 2 \cdot 10^{18} \text{ cm}^{-3}$  and the acceptor concentration was  $N_a \approx 10^{18} \text{ cm}^{-3}$  respectively, while the CdS specimens the residual impurity was  $N \leq 10^{16} \text{ cm}^{-3}$ . The results of these experiments indicate that both amplitude and shape of laser emission pulses depend not only on the excitation level but also on the excitation geometry, particularly on the number and the spacing of electron beams. They reveal different thresholds for emission along and across the electron beams, a change of direction causing an appreciable decrease of the emission pulse duration relative to the excitation period. Qualitative

Qualitative and approximate quantitative theoretical analysis for thin electron beams, an exact solution of a three-dimensional wave equation being mathematically prohibitive, confirms the experimentally established feasibility of widely controlling the emission pulses of semiconductor lasers by using several electron beams for excitation. Figures 5; tables 1; references 5: all Russian.

ON FORMATION OF MASS DISTRIBUTIONS OF FRAGMENTS OF FISSION OF NUCLEI LIGHTER THAN THORIUM

Moscow YADERNAYA FIZIKA in Russian Vol 43, No 5, May 86 (manuscript received 10 Apr 85) pp 1125-1136

[Article by M.G. Itkis, S.I. Mulgin, A.Ya. Rusanov, A.N. Okolovich (Nuclear Physics Institute, Kazakh SSR Academy of Sciences) and G.N. Smirenkin (Physics and Energy Institute, Obninsk)]

[Abstract] An approach was developed to quantitative analysis of formation of mass distributions of fragments in the process of fission of preactinide nuclei. For quantitative description of mass distributions of fragments, description of level density, based on a superfluidic model, was used, with phenomenological consideration for collective and shell effects and with clarifications, required by analysis of integral fissionability of preactinide nuclei of nuclear deformation  $V(M)$  and components thereof. Results of the analysis demonstrate adequacy of the adopted description of rearrangement of shells with energy and of mass distribution of fragments as a whole and reliability of the procedure of restoration of shell corrections. The experimental information on a shell correction in a transient state as a function of asymmetric deformation (mass of fragments) was obtained for the first time; it was compared to a number of previously published theoretical calculations. Experimental data for  $^{213}\text{At}$  demonstrated a break in temperature dependencies of variances, which is rather well described by calculated curves; a conclusion was made that variance measurements could become one of the most sensitive methods for studying processes of phase transition of excited nuclei from superfluidity to a normal state. Experimental data on fission mode  $Y(M)$  in the case of fission of  $^{213}\text{At}$  at excitation energy  $U = 7.7$  MeV were compared to results of various calculations. An attempt was made to calculate  $Y(M)$  for heavier nuclei, using the same approach. The  $^{227}\text{Ac}$  nucleus was selected, because it is close to  $^{213}\text{At}$  and because description of mass distribution of fragments that have a three-hump shape is traditionally used for testing theoretical models of fission asymmetry. On the whole, calculations agreed with the experiment. Figures 6, references 32: 19 Russian, 13 Western.

# MASS DISTRIBUTIONS OF FISSION FRAGMENTS OF HEATED NUCLEI AND DROPLET MODEL

Moscow YADERNAYA FIZIKA in Russian Vol 43, No 5, May 86 (manuscript received 28 Jun 85) pp 1101-1111

[Article by Ye.N. Gruzintsev, M.G. Itkis, S.I. Mulgin, V.N. Okolovich, A.Ya. Rusanov (Nuclear Physics Institute, Kazakh SSR Academy of Sciences) and G.N. Smirenkin (Physics and Energy Institute, Obninsk)]

[Abstract] Measurements of fission parameter  $X$ , conducted by the authors earlier, were continued in the described work for lower values of  $X$ . A group of nuclei, from Er to Os, was studied. The studies were conducted at the Alma-Ata isochronic cyclotron U-150. The method for measuring mass distributions, using spectrometry of twin fragments, was improved in order to obtain the required statistical accuracy. In measurements, spectrometry targets of fissioned isotopes  $^{162}\text{Dy}$ ,  $^{169}\text{Tm}$ ,  $^{176}\text{Hf}$ ,  $^{181}\text{Ta}$ ,  $^{180}\text{W}$ , obtained by vacuum spraying by a high-current electron gun on substrates, made of  $\text{Al}_2\text{O}_3$ , were used. Experimental data were discussed. Stability of saddle forms with respect to mass-asymmetrical deformation in a liquid droplet model (MZhK) was examined. Five principal versions of the MZhK were described. The effect of descent from the barrier vertex was examined. Relation between the stability parameter  $Q(X)$  and  $X$  was described; the experimental relation was in perfect agreement with the theory, although maximum  $Q(X)$  in experiments and in theory did not agree. The characteristic behavior of  $Q(X)$  makes it a very useful reference point for testing parameters of fluctuation-dissipative dynamics and the droplet model. Specific character of dependence of  $Q$  on nucleon composition of nuclei and comparatively easily achievable high accuracy of variance measurements facilitate application thereof in future studies of the macroscopic mass and energy component. Figures 6, tables 2, references 35: 17 Russian, 18 Western.

#### CHERENKOV ATOM RADIATION

Leningrad PISMA V ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 12, No 22, 26  
Nov 86 (manuscript received 8 Aug 86) pp 1369-1373

[Article by M.Ya. Amusya and A.V. Solovyov]

[Abstract] It was demonstrated that in moving through a transparent media with velocity, exceeding the velocity of light in this medium, a neutral atom, spherically symmetrical in its own frame of reference, generates [Cherenkov radiation], comparable in intensity to ChI of a quadrupole. The causes of ChI generation were explained. The process of ChI of a relativistic atom in the lower order of the perturbation theory was described. It was demonstrated that intensity of ChI of a system of charged particles is determined by its form-factor features. In systems with a zero form-factor, such as positronium, muonium etc., there is no ChI effect whatsoever. Ionization of an ultrarelativistic atom will be hindered by the fact that in a laboratory reference frame ionization potential of such atom is higher than its ionization potential in its own reference frame. 1 figure, references: 3 Russian.

MICROSCOPIC CALCULATIONS OF ENERGY AND TRANSITIONAL DENSITIES OF GIGANTIC MONOPOLISTIC RESONANCES IN NUCLEI

Moscow IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA in Russian Vol 50, No 10, Oct 86 pp 2071-2075

[Article by M.V. Stoitsov, I.Zh. Petkov and S.S. Dimitrova (Nuclear Research and Power Institute, Bulgarian Academy of Sciences)]

[Abstract] Results of earlier works by the authors were generalized. It had been demonstrated that gigantic monopolistic resonances (GMR) could be successfully interpreted as dynamically related volume and surface oscillations of nuclear density, using wave functions of the local-scale transformation method (MLMP). In this case, results, obtained in chaotic phases approximation, are reproduced with good accuracy not only for heavy, but also for medium and light nuclei. The proposed trial wave function makes it possible to reproduce with good accuracy calculations of the Hartree-Fock (HF) method for the basic nuclear state. Results for  $0^+$ -excited states, obtained in MGK [generator coordinate method] and AVZ HF [adiabatic time-dependent Hartree-Fock method] with consideration given to surface and volume oscillations of nuclear density, were compared. The objective of the studies was to demonstrate that, although there are considerable differences between the methods in describing basic nuclear states, their predictions for GMR are in complete agreement. Combination of surface and volume vibrations leads to generation of scaling (SK)-type oscillations, with energy close to surface mode excitation energy, and anti-scaling (ASK)-type oscillations, with excitation energy almost twice that of the volume mode. Energies of the first  $0^+$ -excited states, obtained in MGK and AVZ HF for  $^4\text{Ne}$ ,  $^{16}\text{O}$  and  $^{40}\text{Ca}$  nuclei, were compared to Skyrme forces. Close results were obtained for both methods. The difference between the two methods was only observed for the lightest nuclei. Transitional densities for various excitation types for  $^{16}\text{O}$  and  $^{40}\text{Ca}$  were studied. Figures 2, references 7: 4 Bulgarian, 3 Western.

#### FOUR-LEPTON DECAYS AND ELECTROMAGNETIC RADIUS OF K-MESON

Moscow YADERNAYA FIZIKA in Russian Vol 44, No 4(10), Aug 86  
(manuscript received 5 Nov 85) pp 1088-1093

[Article by D. A. Mzhaviya, G. V. Mitselmakher and F. G. Tkebuchava,  
Joint Institute of Nuclear Research]

[Abstract] Rare decays of a K-meson and the momentum dependence of corresponding decay form-factors are analyzed for information about the structure of particles, simultaneous weak and electromagnetic interactions such as four-lepton decays being particularly informative with regard to the structure of hadrons. The probabilities of  $K^+ \rightarrow l_1 l_2^+ \sim l_1' l_2'^+$  decays ( $l, l'$  - electrons or muons) are calculated on the basis of the D. Yu. Bardin theory, with a matrix element represented as the sum of two terms according to the schematic diagram of these processes. The differential probabilities have been computed according to the SHCOONSCHIP program (H. Strubbe). Data of the CERN 1976 electronic experiment (A. M. Diamant-Berger) have been evaluated for semiempirical relations between decay form factors and decay probabilities. The results indicate that from available data (although they are statistically meager), it is possible to independently estimate the electromagnetic radius of a K-meson. The authors thank B. F. Kostin and N. L. Rusakovich for great assistance, also D. Yu. Bardin, B. M. Pontekorvo, and L. I. Lapidus (deceased) for helpful discussions. #### GLUON STRUCTURE AND THE STRONG INTERACTIONS OF HIGH-ENERGY HADRONS

Moscow YADERNAYA FIZIKA in Russian Vol 44, No 4(10), Aug 86  
(manuscript received 30 Sep 85) pp 1047-1052

[Article by A. V. Kiselev and V. A. Petrov, Institute of High-Energy Physics,  
Serpukhov]

[Abstract] The structure of a hadron and the interactions of its components are examined on the basis of a particular model, namely the model of gluon fields based hypothetical gluon dominance, inasmuch as the "inverse problem" of determining them cannot be solved by a model-independent method. Analytical expressions for the distribution of gluon fields in a hadron and for the amplitudes of gluon-gluon interactions, according to this model, yield the total cross-section for hadron A -- hadron B interaction. Analysis of the phenomenological consequences of this model and of experimentally established facts reveals that the gluon dominance model reproduces results based on the additive quark model, despite its different nature here. It also suggests parton-hadron duality. Calculations as well as measurement of a linear trajectory made by the UA4 Group (J. Velasco) and measurement of inelastic diffraction made by the UA5 Group (H. Schmickler), both reported

at the Talk International Conference on High-Energy Physics (Bari, July 1985), indicate some relation between the Pomeranchuk trajectory and the Regge trajectory of a glueball. The authors thank A. A. Logunov for fruitful discussion of basic ideas, also S. S. Gershteyn, M. A. Mestvirishvili, L. D. Solov'yev, S. M. Troshin, and N. Ye. Tyurin for valuable comments. Zaytsev, Institute of High-Energy Physics, KaSSR Academy of Sciences, Alma-Ata]

[Abstract] New experimental data on inclusive formation of the mesons  $\rho^0(770)$ ,  $f(1270)$  and the scalar meson  $S^*(975)$  during  $pp$ -scattering at 32 GeV/s have been obtained from the spectra of effective masses of  $\pi^+\pi^-$ -pairs, the scalar meson  $S^*(975)$  evidently forming during the  $\pi^+\pi^- \rightarrow K_S^0 K_S^0$  process. Approximation of the measured distributions of these effective masses  $d\sigma/dM$ , has yielded total inclusive as well as semiinclusive and differential cross-sections. Differential cross-sections of distributions over the longitudinal component and over the transverse component of the momentum have been calculated for each of those resonances on the basis of the LUND fragmentation model of soft collisions. Also the products of meson  $\rho^0(770)$  and meson  $f(1270)$  fission have been analyzed both qualitatively and quantitatively. Figures 9; tables 1; references 21: 4 Russian, 17 Western.

## ELECTROMAGNETIC PROPERTIES OF NEUTRINO IN SUPERSYMMETRIC THEORIES

Moscow YADERNAYA FIZIKA in Russian Vol 44, No 4(10), Aug 86  
(manuscript received 28 Oct 85) pp 1043-1046

[Article by T. M. Aliyev, Institute of Physics, AzSSR Academy of Sciences]

[Abstract] The magnetic moment and the life time of a Dirac neutrino as well as the width of  $\nu_H \rightarrow \nu_L \gamma$  decay are calculated on the basis of supersymmetric theories, taking into account mixing of scalar leptons with gauge and Higgs fermions. Omission of mixing has been found to result in appreciable errors. With constraints on the masses of supersymmetric particles applied here, and assuming oscillations between two neutrino states, these calculations yield a supersymmetric component of the magnetic moment 50% larger and a neutrino life time one order of magnitude shorter than according to the standard Glashow-Weinberg-Salam theory. The author thanks V. I. Zakharov, M. I. Vysotskiy, and V. A. Kuzmin for helpful discussion. Figures 1; tables 1; references 13: 2 Russian, 11 Western.

## INVERSE PROBLEM FOR QUANTUM THEORY OF SCATTERING IN NEW FORMULATION

Moscow YADERNAYA FIZIKA in Russian Vol 44, No 4(10), Aug 86  
(manuscript received 24 Sep 84) pp 952-959

[Article by I. V. Poplavskiy and A. A. Shiyan, Odessa Institute of Construction Engineering]

[Abstract] A new formulation of the inverse problem for the quantum theory of scattering is proposed, a physically as well as mathematically significant one inasmuch as neither the phase shifts of momentum or energy at a fixed orbital moment nor the phase shifts of the orbital moment at fixed momentum or energy are always known. In previous formulations the magnitude of the Coulomb interaction constant was assumed to be fixed. The new formulations waives this constraint and restores the nuclear interaction potential involving either a charged particle and members of an isotopic multiplet or two isotopic multiplets, when the phase shifts, which depend on the magnitude of the Coulomb interaction constant, are known at fixed momentum and orbital moment. Analytical continuation of the Coulomb interaction constant into the complex space facilitates solution of the inverse problem for the relativistic generalization of the corresponding partial Schroedinger equation on the basis of measured phase shifts, a phase shift being resolved into its pure nuclear component and nuclear-Coulomb interference component. With the aid of the solution are determined the properties of the nuclear interaction potential and is constructed the  $\pi^+ p$ -interaction quasi-potential in the  $S_{31}$ -state at two energy levels 263.7 MeV and 310 MeV in the laboratory system. The new approach is further demonstrated on  $pN$ -scattering in the  $^1S_0$ -state and the low-energy phase shift of  $\bar{p}p$ -scattering in that state.

The authors thank A. Ya. Kreyzerova for assistance in numerical calculations. Figures 2; tables 2; references 25: 19 Russian, 6 Western (1 in Russian, translation).

# PASSAGE OF FISSILE NUCLEUS THROUGH BARRIER TO SCISSION IN MULTIDIMENSIONAL DIFFUSION MODEL

Moscow YADERNAYA FIZIKA in Russian Vol 44, No 4(10), Aug 86  
(manuscript received 13 Nov 85) pp 897-905

[Article by G. D. Adeyev and N. I. Pischasov, Omsk State University]

[Abstract] The dynamics of a fissile system and particularly evolution from the ground state are analyzed on the basis of the multidimensional Fokker-Planck equation, with the fission process described in the Kramers sense. As model has been selected the Fokker-Planck equation in functions representing the distributions of collective coordinates and conjugate moments. The case of three collective coordinates  $c, h, \alpha$  is considered, these being the most important ones in fission dynamics ( $c$ - elongation parameter). The equation is solved by the method of a reduced propagator, solution by the two methods of a propagator and finite differences for several degrees of freedom not being feasible at the present state of the art. The apparatus is applied first to a simple problem, namely passage of a nucleus through a multidimensional potential barrier with negligible quantum effects, assuming a constant effective temperature of 1 MeV. It is then applied to passage of a cluster of nuclei through such a barrier with relativistic effects taken into account by appropriate coefficients in the Fokker-Planck equation. An analysis of the results indicates that for determining the distributions of fragments produced by fission of heavy nuclei, including an astatine nucleus, it is permissible to ignore the initial state at the saddle point and to consider only the descent from saddle point to scission. The authors thank Yu. A. Lazarev and V. V. Pashkevich for helpful discussions. Figures 2; tables 1; references 24: 5 Russian, 19 Western.

SEARCH FOR NEW MECHANISM OF NUCLEAR FISSION BY HIGH-ENERGY PROTONS BASED ON ISOTOPE DISTRIBUTIONS OF FRAGMENTS

Moscow YADERNAYA FIZIKA in Russian Vol 40, No 4(10), Oct 86  
(manuscript received 21 Oct 85) pp 867-881

[Article by B. N. Belyayev, V. D. Domkin, and V. S. Mukhin, Radium Institute imeni V. G. Khlopin]

[Abstract] Nuclear fission of iridium by high-energy protons was studied in an experiment, the purpose being to find traces of a reaction channel producing fragments with various N/Z ratios. The target, natural Ir with a nucleus much lighter than that of  $^{238}\text{U}$ , was bombarded with 1 GeV protons. The fission fragments were analyzed on a mass-spectrometer "in line" with the synchrocyclotron at the Leningrad Institute of Nuclear Research. Qualitative analysis has revealed an  $\text{Ir}(p,X)\text{Rb}$  reaction and quantitative analysis has yielded the cross-sections for formation of  $^{76-92}\text{Rb}$  isotopes. The excess yield of  $^{88-92}\text{Rb}$  isotopes, above the level according to a Gaussian distribution and approximately 4% higher than the sum of yields of all Rb isotopes according to projections based on the  $^{76-86}\text{Rb}$  yields made by the method of least squares, is attributable to an additional new fission mechanism. This preequilibrium mechanism (B. D. Wilkins and associates: PHYSICS REVIEW LETTERS Vol 43, 1979, p 1080) would also explain the asymmetric distribution of Rb isotopes resulting from bombardment of a target with  $A \leq 200$  by protons with an energy as high as 1 GeV. Figures 4; tables 1; references 19: 7 Russian, 12 Western.

IMAGE RECORDING IN NEUTRON MICROSCOPE

Moscow PISMA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI in Russian Vol 44, No 5, 10 Sep 86 (manuscript received 8 Jul 86) pp 213-216

[Article by S. S. Arzumanov, S. V. Masalovich, A. N. Strepetov, and A. I. Frank, Institute of Atomic Energy imeni I. V. Kurchatov]

[Abstract] An experiment with a neutron reflection microscope was performed including for the first time all components necessary for recording the image of an object, namely a source of ultracold neutrons, a pair of achromatic concave mirrors, and a scintillator-detector. The liquid-hydrogen neutron source from the Leningrad Institute of Nuclear Physics generated a flux of  $6 \cdot 10^3$  neutrons/( $\text{cm}^2 \cdot \text{s}$ ) intensity passing to the object through an L-guide with a  $45^\circ$  plane mirror inside under the stage. The pair of concave mirrors, spherical ones with 20 cm and 30 cm radii of curvature respectively, formed a cavity above the stage with center holes of a 0.25 numerical aperture for passage of rays reflected first by the upper one and then by the lower one so as to produce a 1.4x magnification. Both mirrors were coated with a  $^{58}\text{Ni-Mo}$  film limiting the speed of neutrons to approximately

8 m/s. The scintillator-detector above the mirrors consisted of three layers: 10-15  $\mu\text{m}$  thick ZnS + 0.2-0.3  $\mu\text{m}$  thick Al + 10  $\mu\text{g}/\text{cm}^2$  thick LiF containing  $^6\text{Li}$  and  $^7\text{Li}$  in 1:1 ratio. This detector was placed at the entrance to a fiber-optic light guide leading to an image converter tube above with a photographic film on top. Two-dimensional images of two objects were recorded with this equipment, namely a cruciform diaphragm and a 200 nm thick Ni-film pattern deposited on a 0.35 mm thick silicon wafer. The authors thank A. P. Serebrov at the Leningrad Institute of Nuclear Physics for support and hospitality, also P. S. Yaydzhiev, A. V. Vasilyev, A. I. Ioffe for assistance, N. V. Borovik for coating the mirrors, and V. G. Nikolskiy as well as his coworkers for preparing the test objects. Figures 2; references 10: 3 Russian, 7 Western.

[Abstract] A universal source of polarized cold and ultracold neutrons is operating in the VVR-M hydrogen-moderated hydrogen-cooled intermediate-power reactor at the Leningrad Institute of Nuclear Physics since the end of 1985. The liquid-hydrogen moderator with a 1  $\text{dm}^3$  capacity is located at the center of the reactor core, surrounded by a lead shield which reduces the radiative heat load. The flux of thermal neutrons is  $(1.5-2) \cdot 10^{14}$   $\text{n}/(\text{cm}^2 \cdot \text{s})$ , the total heat release in the source is 2 kW (800 W in the core, 1200 W in the hydrogen). The neutron source is cooled with 6  $\text{dm}^3$  of liquid hydrogen circulating with a velocity as high as 1 m/s at full reactor power between a reservoir and a helium refrigerator, driven by the temperature gradient and the heat exchanger asymmetry. The spectrum of cold and ultracold neutrons is determined by the moderator and also by the bent neutron duct responsible for the short-wave cutoff. The spectrum was measured by the transit method with an ionization fission chamber for recording cold neutrons and with a He proportional detector for recording ultracold ones. The advantage in neutron yield attained by using liquid hydrogen (16.3 K) instead of gaseous hydrogen (300 K) was found to increase with increasing neutron wavelength, reaching a factor of 40-50 for 10-20 Å neutrons, and to shift the maximum flux intensity from 3 Å neutrons to 4 Å neutrons.

Having cooled the hydrogen below the 25.3 K boiling point had increased the yield of long-wave neutrons by 25%. With 90+5% polarization and velocities up to 7.8 m/s, this source produces cold neutrons at a rate up to  $3 \cdot 10^{10}$  n/s (flux intensity up to  $6 \cdot 10^8$  n/cm<sup>2</sup>·s) and ultracold neutrons at a rate up to  $5 \cdot 10^5$  n/s (flux intensity up to  $6 \cdot 10^3$  n/cm<sup>2</sup>·s). The authors thank A. V. Strelkov (Joint Institute of Nuclear Research) for supplying detectors specially designed for ultracold neutrons, also P. S. Yaydzhev (Institute of Nuclear Research and Nuclear Power Engineering, BSSR Academy of Sciences), A. V. Vasilyev, V. V. Nesvizhevskiy, V. G. Syromyatnikov, N. K. Pleshanov, V. A. Priyemyshev, M. S. Lasakov, Yu. V. Borisov, and A. B. Brandin for assisting in various stages of the project. Figures 3; references 2: Western.

PROPAGATION OF RADIATION ALONG A CONSTRICTING OPTICAL WAVEGUIDE

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian, Vol 61, No 2, Aug 86  
(manuscript received 7 Feb 86) pp 432-434 (Cat. 10)

[Article by V. M. Andreyev, K. F. Yeskin and Ye. Ye. Glukhova]

[Abstract] The parabolic equation approximation was used to analyze the propagation of radiation along a constricting planar waveguide. The use of the parabolic equation approximation is analogous to the paraxial approximation of geometric optics. The major advantage of the parabolic equation is a decrease in order with respect to  $z$ . The method outlined was used to calculate the distribution of the field of the electromagnetic wave in various cross sections of a constricting planar waveguide with the parameters of air, vinyl trimethylsilane and plexiglass, angle of constriction 1:120, initial thickness  $0.65 \mu\text{m}$ , wavelength  $0.63$  to  $8 \mu\text{m}$ . The time of computation of one step with respect to  $z$  was 1.2 seconds on a YeS-1050 computer. The parabolic equation approximation is found to describe the process of radiation from a constricting planar optical waveguide with sufficient accuracy; allowing determination of the distribution of the field in any cross section of the waveguide. CROSS SECTION OF RESONANT RAMAN SCATTERING OF LIGHT BY POLYENES

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian Vol 61, No 2, Aug 86  
(manuscript received 28 Jan 86) pp 299-302 (Cat. 10)

[Article by V. V. Verdyugin, K. Ya. Burshteyn and P. P. Shorygin]

[Abstract] An experimental study is presented of the resonant Raman spectra of  $\beta$ -carotene. Absolute differential cross sections are obtained for the most intensive Raman spectral lines with excitation at the absorption maximum,

and a theoretical analysis is presented of the variation in absolute differential cross section as a function of a number of conjugate double bonds in the polyenes. Absolute differential cross sections were measured for  $2 \cdot 10^{-6}M$  solutions of  $\beta$ -carotene in cyclohexane. The calculations indicated values of  $\sigma_{C=C}^{max}$ , close to the experimental values, indicating that the predicted variation in specific absolute differential cross section as a function of number of double bonds with a maximum at  $M=5$  actually does occur. Future studies are planned to refine these results still further. Figure 1, references 12: 8 Russian, 4 Western.

$\text{Cr}^{3+}$  SPECTROSCOPY IN POSITION WITH CENTER OF SYMMETRY IN ALEXANDRITE

Minsk ZHURNAL PRIKLADNOY SPECTROSCOPII in Russian Vol 44, No 3, Mar 86  
(manuscript received 20 Dec 84) pp 491-494

[Article by A.P. Yeliseyev, A.M. Yurkin, Ye.N. Fyodorova and Ye.G. Samoylova]

[Abstract] Spectroscopy characteristics of  $\text{Cr}(\text{C}_i)$  ion in alexandrite  $\text{BeAl}_2\text{O}_4:\text{Cr}$  were studied, as information thereon in literature was practically non-existent. Synthetic alexandrite monocrystals, grown according to Chokhralskiy method in the [001] direction, were studied. Specimens had the form of polished cubes with edges, parallel to crystallographic axes; chrome concentration was equal to 0.005-0.25 mass %. Photoluminescence (FL) spectra of alexandrite at 80 K are characterized by a rich fine structure. Judging by the presence of resonance analogs in luminescence excitation spectra (SVL), four most intensive lines can be interpreted as non-phonon lines (BFL), each accompanied by a structured phonon wing. In order to determine diagrams of energy levels of  $\text{Cr}(\text{C}_i)$  under the conditions of low absorption rate of the center of symmetry and well developed and reliably identified BFL in FL spectra, luminescence excitation spectra, obtained at 80 K, were used. The conducted studies of luminescence in alexandrite made it possible to come to a conclusion that in the case of the process of stimulated radiation generation  $\text{Cr}^{3+}(\text{C}_i)$  ions should be considered parasite centers, responsible for external quenching of FL of  $\text{Cr}^{3+}(\text{C}_s)$  ions, wherein quenching efficiency increases, as activator concentration ( $\text{Cr}^{3+}$  is the activator ion) increases. Figures 2, references 9: 3 Russian, 6 Western.

## CERTAIN LUMINESCENT PROPERTIES OF GaN:(Zn-O) STRUCTURES

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 3, Mar 86  
(manuscript received 6 Dec 84) pp 488-490

[Article by M.D. Shagalov and Ya.D. Lebedev]

[Abstract] In order to test the truthfulness of an assumption of homogeneous distribution of the zinc-oxygen complex over the thickness of an m-i-n GaN:(Zn-O) structure, experiments were conducted on distribution of luminescence centers in the structure. Photoluminescence (FL) was excited by a mercury lamp (365 nm line) and an LPM-11 laser (446.1 nm line) radiation. Because of the different degree of excitation FL penetration in the two cases, an assumption can be made of heterogeneous distribution of additives over the thickness of the structure. Centers of the zinc-oxygen complex are concentrated in the i-n junction area. Despite this conclusion, the possibility of excitation of the zinc-oxygen complex by radiation with quantum energy, corresponding to the area of principal absorption of gallium arsenide, is not precluded; one should just select the wavelength of exciting FL radiation, wherein GaN absorption factor would make possible penetration into the structure. However, studies of this type, conducted in this work, still had not detected FL, similar in polarization properties to EL [electroluminescence]. Excitation FL of the i-n structure in the case of its illumination from the surface in the boundary area of principal absorption cannot develop in a region, where centers of the zinc-oxygen type are concentrated. Figures 3, references 5: 4 Russian, 1 Western.

## EXCITATION SPECTRUM OF VISIBLE LIGHT - SIMULATED RECOMBINATION LUMINESCENCE OF GAMMA-IRRADIATED COPOLYMERS OF METHYL METHACRYLATE WITH DIMETHACRYLOXYMETHYL ANTRACEN

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 3, Mar 86  
(manuscript received 18 Dec 84) pp 410-415

[Article by S.V. Lotnik, V.N. Korobeynikova, V.P. Yazakov and L.Kh. Bikchurina]

[Abstract] Anthracene is an efficient electron trap. It was hoped that introducing an anthracene fragment, that has bright fluorescence and a characteristic absorption spectrum in the anion-radical state, into a polymer would facilitate identification of an electron trap, if the fragment behaved as the trap. In order to do this, a copolymer of methyl methacrylate (MMA) with dimethacryloximethyl anthracene (DMMA) was produced, wherein polymethyl acrylate chains were cross-linked by anthracene fragments. Copolymer 9,10-bis(methacryloximethylene)-anthracene was synthesized. Product yield was equal to 58% of the theoretical yield. After gamma-irradiation at 77 K, the copolymer gets blue coloration, which completely disappears, when heated to 250-300 K. It was obvious that the anthracene fragment was the acceptor of electrons in the copolymer. Radiothermoluminescence of the polymer was caused by recombination process, wherein electrons, captured by the anthracene fragment, participated. It was found that a singlet-excited anthracene fragment was the only emitter of recombination luminescence photons. Two components, a rapid and a slow one, were identified in glow build-up and decay curves, which could be attributed to the presence of two types of hole traps ( $PMMA^+$  and  $A^+$ ), separated in space. Figures 2, references 15: 10 Russian, 5 Western.

## HEATING OF HELIUM PLASMA BY POWERFUL PROTON BEAM FOR SPECTROSCOPIC PURPOSES

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Apr 86  
(manuscript received 20 Dec 84) pp 563-567

[Article by M.S. Artyev, A.A. Kuznetsov and S.S. Sulakshin]

[Abstract] An ion gun was developed specifically for generation of gas plasma, and experiments on helium plasma spectroscopy were conducted. Current density of a proton beam was measured at the axis of a gas tube with the help of a collimated current collector. It was possible to measure the full beam current and relations between current density and the longitudinal electron component. The lateral distribution in the beam was not studied, but it is possible to derive it from distribution of helium plasma glow. The ion gun was tried out in helium plasma excitation. VCh helium at a pressure, equal to  $(0.2-1) \times 10^{-5}$  Pa, was used. Gas and vacuum chambers were divided by 4.5 micrometers thick mylar film. Rubber seals caused small leakages of nitrogen and other additives from air into the gas. In order to eliminate intense glow that was due to considerably higher ionization potential of He, compared to that of additives, gas was slowly (at the speed of 0.04 l/s) pumped through the tube. Using a MDR-4 monochromator, FEU-140 and an S8-12 oscilloscope, Stark contour of He II 468 nm ion line was measured. Electron plasma concentration was assessed by contour widening, and electron temperature was assessed, using the maximum plausibility method. The derived data confirm calculations of kinetics of helium plasma, excited by a proton beam. It was concluded that the ion gun met requirements of the spectroscopic plasma experiment and that it made it possible to excite plasma of inert gases at atmospheric pressure at the length of up to 100 cm with high uniformity and stability. The first results of spectroscopic measurements of electron concentration of helium plasma were derived; they agree with theoretically predicted results. Recombination disbalance of helium plasma, excited by a proton beam, was confirmed. Figures 4, references 11: 9 Russian, 2 Western.

DMITRIY SERGEYEVICH ROZHDESTVENSKIY: FOUNDER OF THE FIRST SOVIET OPTICAL SCHOOL (ON THE 110-TH BIRTHDAY ANNIVERSARY)

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Apr 86 (manuscript received 21 Nov 85) pp 535-545

[Article by Yu.A. Khranov]

[Abstract] D.S. Rozhdestvenskiy (1876-1940), a Soviet physicist, not only made a tremendous contribution into the theoretical and applied optics, but also in organization of scientific research, by founding the State Optics Institute (GOI), one of the first scientific research institutes in the country, and the first Soviet optical school. He performed fundamental works on anomalous dispersion, on atom structure theory, on microscopy; he presented a complete analysis of magnesium ion spectrum and forecasted magnetic origin of doublets and triplets. D.S. Rozhdestvenskiy scientific school originated in 1915, when he was a Peterburg University Professor. Before the Great October Socialist Revolution there were only about 100 physicists in Russia. GOI was created on D.S. Rozhdestvenskiy's initiative in December, 1918. A number of new trends in optics, both purely scientific and technical, were developed in GOI. At the same time, GOI was educating new young physicists-opticians, combining studies and research work. In 1922, GOI had 86 employees. A block-diagram in the article shows evolution of the D.S. Rozdestvenskiy school, listing his disciples and scientific trends they develop. References: 14 Russian.

## INTERFEROMETRY METHOD FOR MEASURING COEFFICIENT OF RADIATION TRANSMISSION

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Oct 86  
(manuscript received 24 May 85) pp 644-647

[Article by A.P. Burmakov, A.V. Kolesnik and A.Yu. Zhumar]

[Abstract] The nature of the interferometry method was studied and its error and sensitivity were assessed. The proposed method was based on connection between luminosity of interference bands of a double-reflecting interferometer near the observed point of the interference pattern and ratio of intensities and the degree of reciprocal coherence of beams, interfering in the vicinity of this point. It was determined that for optically dense materials accuracy of measurement of transmission ratio, using the interferometry method, could be significantly higher (by more than two orders of magnitude) than accuracy of the method, based on recording ratio of of passing and incident beams intensities. At low optical densities and in areas of special points, error of the interferometry method increased sharply. The interferometry method makes it possible to simultaneously measure transmission ratio and refractive index of a material, placed into the interferometer. The method was used for measuring absorption index of a pulse flow of dense copper plasma, created by a generator on the basis of electrical explosion of a conductor. It was suggested that the interferometry method could be spread to reflectivity measurements and that, in addition to the optical range, the examined features of the method are valid in other electromagnetic and acoustic wavelength ranges. ## TRIPLET-TRIPLET ANNIHILATION OF MOLECULES OF AROMATIC HYDROCARBONS AND DYES IN SOLUTIONS

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 44, No 4, Oct 86  
(manuscript received 11 Apr 83, after rework 25 Feb 86) pp 584-591

[Article by L.V. Levshin, G.A. Ketsle and Yu.A. Soynikov]

[Abstract] Known explanations of triplet-triplet annihilation (TTA) do not reveal the full set of elementary acts, responsible for transformation of excitation energy in contact complexes of triplet molecules and features thereof. At the same time, a triplet pair can serve as a good model in search of a solution of the problem of controlling decay of excited contact complexes in order to obtain reaction products with specified properties. Studies were conducted in order to solve this problem. Systems, comprised of dyes and aromatic hydrocarbons (AH), were used as objects. Retarded fluorescence (ZF) of solutions of acridine dyes (energy donors) and anthracene (acceptor) were studied. In order to compare efficiency of TTA for different systems, concentration of triplet donor molecules was maintained constant. Sensitized population of anthracene triplet levels was achieved due to T-T [triplet-triplet] transfer of energy from acridine orange (AO), roduline orange (RO) and tripaflavin (TF). Velocity constant of transfer of triplet energy from the donor to the acceptor, calculated according to Schtern-Fohlmer formula under the assumption of the absence of reverse transfer of energy, was practically the same for the three systems. As concentration of triplet molecules increased, contribution of a mixed type TTA to ZF TF increased much faster than its contribution to RO and AO glow. The studies demonstrated that for the TF-anthracene system ZF of the acceptor was practically determined entirely by TTA of its own molecules, whereas when paired with AO, a mixed type TTA contributes to anthracene ZF intensity, in addition to its own TTA contribution. Velocity constant of tripaflavin ZF intensity decay was less than deactivation velocity of triplet states of its molecules. New data on properties of triplet pairs were obtained by establishing a relation between characteristics of a singlet channel of contact complex decay, energy of a pair and energies of excited states of molecules, comprising the pair. It was shown that annihilation processes were controlled by diffusion motion of molecules. At the same time, probability of decay of anthracene triplet pair with acridine dyes by populating the  $S_1$  state of donor molecules increases from the AO-anthracene to TF-anthracene system. This increase was explained by employing the proposed complement to the well known model of spin-spin

evolution in a triplet pair. The studies of the mixed type TTA in systems, comprised of molecules of acridine dyes and AU, made it possible to substantiate the assumption that probability of decay of a triplet pair according to a singlet channel scheme strongly depends the size of energy range between energy levels of the contact complex of triplet molecules and excited singlet levels of molecules of dyes and AU, closest energywise to the level of a mixed type triplet pair. EFFECT OF ADDING TO XENON OTHER INERT GASES ON LUMINESCENCE YIELD OF  $\text{Xe}_2^*$ -MOLECULES EXCITED BY ELECTRON BEAM

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 45, No 1, Jul 86  
(manuscript received 5 Mar 85) pp 39-45

[Article by Yu. I. Dymshits and V. A. Korobitsyn (deceased)]

[Abstract] In an experiment with electron-beam excitation of xenon, other inert gases were added and the resulting luminescence yield of  $\text{Xe}_2^*$ -molecules within the 170+7 nm band was evaluated. The electron-beam parameters were: cross-section  $2 \times 0.5 \text{ cm}^2$ , electron energy 300 keV, current density 140 A/cm<sup>2</sup>, pulse duration 5 ns. Tests were performed with pure Xe, its pressure varied over the  $(0.1-6) \cdot 10^5 \text{ Pa}$  range, and with  $\text{Xe} + (1-9) \cdot 10^5 \text{ Pa}$  of another gas (Kr, Ar, Ne, He). Measurements and graphical integration of oscillograms have yielded the dependence of the maximum luminescence intensity, the radiation pulse energy, and the conversion (electron-beam energy to vacuum-ultraviolet radiation) efficiency on the Xe pressure or partial pressure. The results indicate that small additions of Kr, Ne, He increase both the conversion efficiency and the luminescence intensity, maximally when approximately  $10^5 \text{ Pa}$  of Ne or He or  $9 \cdot 10^5 \text{ Pa}$  of Kr is added to  $(1-2) \cdot 10^5 \text{ Pa}$  Xe, but addition of Ar increases both only when the Ar pressure exceeds the Xe pressure and does not change them or even decreases them less Ar is added. ## SOLITON MODE OF PROPAGATION OF LIGHT PULSES THROUGH SINGLE-MODE OPTICAL FIBERS AND PROBLEMS OF ITS EXPERIMENTAL REALIZATION

Leningrad PISMA V ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 12, No 16,  
26 Aug 86 (manuscript received 28 Jun 86) pp 988-991

[Article by V. Yu. Petrunin, A. V. Selishev, V. M. Sysuyev and A. S. Shcherbakov, Leningrad Polytechnic Institute imeni M. I. Kalinin]

[Abstract] Transmission of data over fiber-optic communication lines in the form of solitons appears to be a promising way to increase the speed. Such a mode of data transmission requires proper matching of light source and light guide parameters, to ensure self-compression of anomalously scattering wave packets and formation of steady one-dimensional solitons. Theoretically, propagation of a soliton through a real optical fiber can be described by the cubic Schroedinger equation  $j u_z + u_{tt} + 2u|u|^2 = -j\Gamma u$  ( $u$  - normalized amplitude of electric field intensity in waveguide,  $z$  - normalized space coordinate in direction of propagation,  $t$  - normalized time,  $\Gamma$  - attenuation index) with the right-hand side representing dissipation. For the boundary condition  $u(z=0, t) = u_0 \text{sech}(u_0 t + \phi) e^{j\theta}$  this equation can be

solved as an inverse problem of scattering with the aid of perturbation theory, which ensures exact integration of the corresponding system of Marchenko equations. The solution indicates the requirements for formation and propagation of solitons. An optical data transmission system built experimentally on this basis for design and performance analysis includes a source of ultrashort light pulses (duration  $\tau = 7-30$  ns, wavelength  $\lambda = 1.3-1.6$   $\mu\text{m}$ ), namely a parametric light generator without resonator, a more than 20% efficient coupling, a single-mode quartz fiber 600 m long with a core diameter of 7  $\mu\text{m}$  and a loss factor not exceeding 1.5 dB/km, and a device for recording solitons within the 1.06-1.60  $\mu\text{m}$  range of optical wavelengths by the method of a second-harmonic beam with a  $\text{LiNbO}_3$  crystal followed by a photoreceiver with 1 ps resolution per element for display. This apparatus has yielded necessary data indicating the feasibility of building such a system with Soviet-made components. Figures 2; references 3: 1 Russian, 2 Western.

# ABSORPTION POWER OF $\text{SiO}$ VAPOR IN $X^1\Sigma$ $A^1\Pi$ and $X^1\Sigma$ $E^1\Sigma$ ELECTRON BANDS AT HIGH TEMPERATURES

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 45, No 2, Aug 86  
(manuscript received 22 Mar 85) pp 183-188

[Article by V. S. Matveyev]

[Abstract] The absorption characteristics of  $\text{SiO}$  vapor in the most intense  $X^1\Sigma - A^1\Pi$  and  $X^1\Sigma - E^1\Sigma$  electron bands at temperatures of 2000-10,000 K have been calculated on the basis of the Elsasser random model. This model, representing a band as a statistical superposition of various Elsasser subbands, was approximated for composite spectral-line contours. The energy levels and the frequencies at centers of rotational lines were accordingly evaluated from known values of the spectroscopic constants (electronic terms  $T_e$ , vibrational frequencies  $\nu_e$ , anharmonicity constants  $\nu_e x_e$ , rotational constants  $B_e$ , vibrational-rotational interaction constants  $\alpha_e$ ) for the lower states  $X^1\Sigma$ ,  $A^1\Pi$ ,  $E^1\Sigma$ , with the aid of Henley-London and Frank-Condon factors as well as data on the wavelength dependence of cross-sections for absorption, the Morse function, and recurrence relations allowing extension of available tables. The integral absorptance in each of those two bands of the 27,000-67,300  $\text{cm}^{-1}$  range was then calculated for specific masses ranging from 0.001 to 0.1 cm atm under pressures ranging from 0 to  $10^6$  Pa at several temperatures covering the 2000-10,000 K range. ## PICOSECOND SPECTROSCOPY OF INTERMOLECULAR PROTON PHOTOTRANSFER

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 7, Jul 86  
(manuscript received 17 May 85) pp 1442-1450

[Article by G. M. Yesayan, O. V. Kalaydzidis and L. B. Rubin, Scientific Research Institute of Nuclear Physics, Moscow State University imeni M. V. Lomonosov]

[Abstract] A spectroscopic study of intermolecular proton phototransfer in dyes during transition to the excited state was made, the purpose being to determine the mechanism of this phenomenon and to utilize it for production of effective fluorescent light concentrators. As test objects were selected benzene and tetrahydrofuran solutions of 3-methoxybenzanthrone, both capable of accepting protons, with 3-fluoroacetic acid or toluenesulfonic acid added as proton donor to various concentrations. For recording of the absorption spectra with a "Hitachi-557" spectrophotometer and the fluorescence spectra with a "WP-4" optical multichannel spectrum analyzer, specimens were excited with light of the appropriate wavelength coming from a xenon lamp through a VM-25 monochromator. The kinetics of the fluorescence spectra were measured with a special spectrofluorimeter, for which the specimens were excited with third-harmonic radiation (wavelength  $\lambda = 355$  nm) in pulses of 5 mJ energy and 35-45 ps duration coming from a picosecond YAG:Nd<sup>3+</sup> laser with passive mode locking, through an ML-102 electrooptical modulator for extraction of single pulses, a 2-stage amplifier, a KDP crystal for extraction of the third harmonic, and a set of light filters. The concentration dependence of the fluorescence spectra and the fluorescence kinetics were found to be qualitatively analogous for the dye in each solvent with each proton donor. A quantitative analysis of the data has yielded the concentration dependence of the fluorescence life time, also the proton transfer constants characterizing the rate of forward and reverse proton transfer at molar concentrations of the proton donor over the 0.3-0.5 range (3-fluoroacetic acid) and over the 0.3-0.8 range (toluenesulfonic acid). A quantitative analysis of the photochemical reactions, with the aid of these data, indicates the advantages of using fluorescent light concentrators other than the conventional rhodamine 6G dye as well as the optimum mix of dye and proton donor. NON-LINEAR MODE OF OPTICAL EXCITATION OF RAYLEIGH WAVES IN SILICON; THERMO-ELASTIC AND CONCENTRATION-DEFORMATION MECHANISM

Leningrad PISMA V ZHURNAL TEKHNIЧЕСКОY FIZIKI in Russian Vol 12, No 17, Sep 86 (manuscript received 11 May 86) pp 1067-1071

[Article by S. M. Avanesyan, V. E. Gusyev, B. V. Zhdanov, N. I. Zhyoludiyev, V. I. Kuznyetsov and Ye. G. Petrosyan, Moscow State University imeni M. V. Lomonosov]

[Abstract] The process of generating surface acoustic waves (SAW) during fundamental absorption of light in silicon under the influence of nano-second optical pulses was studied, both experimentally and theoretically. It had been established, that changes in SAW profile, caused by increased intensity of disturbance, are determined by non-linear processes of the evolution of electron-hole plasma and by competition between a thermoelastic and concentration-deformation processes of generation of acoustic waves. The article for the first time studied the effect of the above mechanisms and of non-linear recombination of photoexcited electron-hole pairs (EDP) on the process of optical excitation of SAW. Generated radiation was focused on a crystal by a cylindrical lens; it had a shape of an 8 mm long and 1 mm wide stripe.  $\lambda = 1.06 \mu\text{m}$ , Quories between B.1 0 5J/cm. Distribution intensity of optical radiation was described by a nonlinear set of equations, for which the following assumptions were made: concentration of photoexcited carriers was considerably higher, than the equilibrium concentration; relationship between physical parameters and temperature, as well as diffusion of carriers and photon thermal conductivity could be disregarded; lattice heating from the energy, absorbed by free carriers, and from the non-radiating recombination of electron Holepair prevailed over heating in the process of intrazone relaxation of photo-generated pairs. Approximate solutions of the above set of equations were derived, that are good enough for qualitative analysis of experimental data. Experiments were conducted with monocrystal silicon, cut out along the  $\langle 111 \rangle$  direction in the form of a 30 mm diameter and 10 mm thick cylinder. Radiation of Q switches an  $\text{Nd}^{3+}$  YAG laser with Q-modulation was used. Rayleigh wave velocity was determined experimentally from the change in PAV pulse arrival time, when the distance between the photoexcitation area and a piezoelectric transducer changes. Joint analysis of experimental results and the proposed excitation model made it possible to present a picture of SAW generation in silicon. Figures 2; references 4: 3 Russian, 1 Western.

## RESOLVING POWER OF TUNNELING MICROSCOPE

Moscow POVERKHNOST: FIZIKA, KHIMIYA, MEKHANIKA in Russian No 10, Oct 86  
(manuscript received 28 Oct 85) pp 20-24

[Article by M. V. Krylov and R. A. Suris]

[Abstract] The characteristics of a scanning tunneling-electron reflection microscope for examination of conductor and semiconductor surfaces are evaluated on the basis of a simple model of surface roughness and its image, with consideration of the energy transfer through the scanning aperture and across the vacuum clearance. The wave function for tunneling electrons is expressed as the integral of the product of the wave function for incident electrons and the normal gradient of the Green function for a vacuum gap. The resolution attainable with such a microscope is calculated, assuming a constant potential energy of electrons in the vacuum clearance and thus also constant attenuation distance for the wave function, also disregarding shade effects. Calculations are first based on small-scale roughness, ideally a shallow sinusoidal surface ripple or low step, and then extended to large-scale roughness. ## FLUORESCENCE OF OXAZINE-17 IN PROTON DONOR AND PROTON ACCEPTOR SOLVENTS UPON STEADY OR PICOSECOND-PULSE EXCITATION

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 45, No 3, Sep 86  
(manuscript received 29 May 85) pp 396-400

[Article by B. A. Bushuk, A. N. Rubinov, A. A. Muravyev and A. I. Zhukovskaya]

[Abstract] A spectroscopic study of the dye oxazine 17 was made using two methods of excitation, steady excitation and kinetic excitation with picosecond time resolution, for a determination of its luminescence (fluorescence) characteristics and mechanism in two kinds of solvents. The solvents of the first group were proton donors (heptane, butanol, propanol, ethanol, methanol, glycerin). The solvents of the second group were proton acceptors (pyridine, acetone, dimethyl formamide, DMSO). Measurements have revealed that both absorption and emission spectra in a nonpolar solvent such as heptane shift in the long-wave direction and retain a structure, while in polar solvents such as alcohols they also shift in the long-wave direction but their structure vanishes. In proton acceptor solvents the trends were

found to be generally similar, but the long-wave shift is smaller. Measurements made over the  $-130-(+30)^{\circ}\text{C}$  temperature range revealed a generally nonmonotonic shift of the maximum-fluorescent wavelength, with a large long-wave shift in butanol (with a temperature change from  $-50^{\circ}\text{C}$  to  $30^{\circ}\text{C}$ ) and in glycerin (with a temperature change from  $-30^{\circ}\text{C}$  to  $-10^{\circ}\text{C}$ ) capable of forming an intermolecular hydrogen bond. Measurements were also made with oxazine 17 in a composite solvent, 97% n-heptane (nonpolar) + 3% n-butanol (polar) and 94% n-heptane (nonpolar) + 3% n-butanol (polar, forming intermolecular hydrogen bond) + 3% pyridine (polar, proton acceptor, forming a hydrogen bond with alcohol molecules). In the latter case the fluorescence spectrum shifted not further in the long-wave direction but in the short-wave direction. Picosecond excitation for study of the fluorescence kinetics was provided by single pulses of second-harmonic radiation from a Nd-laser on phosphate glass, extracted by heavy water. The results reveal a long-wave shift occurring in a single stage according to the universal mechanism in proton acceptor solvents and in two stages in alcohols, where fast formation of an exciplex is followed by slower interaction of this complex with surrounding molecules according to the universal mechanism. #### LASER PHOTIONIZATION SPECTROSCOPY OF SELF-IONIZATION STATES OF THULIUM ATOM

Minsk ZHURNAL PRIKLADNOY SPEKTROSKOPII in Russian Vol 45, No 3, Sep 86  
(manuscript received 5 May 85) pp 386-391

[Article by A. A. Atakhodzhayev and V. N. Fedoseyev]

[Abstract] A spectroscopic study of the thulium atom by the method of multi-stage laser photoionization was made, for the purpose of determining the optimum schemes of its 3-stage photoionization. The spectrometer for determination of high and self-ionization states had three standard dye lasers emitting radiation within  $1\text{ cm}^{-1}$  bands in pulses of 1-10  $\mu\text{J}$  energy and 7 ns duration. They were all pumped by radiation from a  $\text{N}_2$ -laser in pulses of 1.5 mJ energy at a repetition rate of 10 Hz. They were tuned to resonance with atomic transitions by means of an MDR-3 monochromator, manually or with the aid of a stepped motor. Atoms were excited into any intermediate state by radiation from two of the dye lasers tuned to corresponding transitions, whereupon radiation of the third dye laser was scanned by recording of photoions with a secondary-electron multiplier for determination of the self-ionization spectrum. Signals were fed through three amplifiers to an SM-3 minicomputer for data processing. The experiment revealed 111 transitions to a self-ionization state within the  $49,872\text{--}53,395\text{ cm}^{-1}$  band. The cross-sections for the most intense transitions in the second stage corresponding to 10 optimum 3-stage photoionization schemes for the thulium atom were calculated by the saturation method so that the relative cross-sections

for transitions from various levels to a self-ionization state could be determined. Figures 2; tables 2; references 22: 13 Russian, 9 Western (1 in Russian translation).

CONFINEMENT OF IONS IN MAGNETIC-MIRROR TRAP WITH SMALL MIRROR RATIO

Moscow FIZIKA PLAZMY in Russian Vol 12, No 10, Oct 86  
(manuscript received 22 Jan 86) pp 1164-1169

[Article by V. I. Yerofeyev and D. D. Ryutov, Institute of Nuclear Physics,  
Siberian Department, USSR Academy of Sciences]

[Abstract] The confinement problem for ions in an array of magnetic-mirror traps is solved analytically for a mirror ratio  $R$  such that  $R-1 \ll 1$ , this case being characterized by a shorter than standard plasma lifetime and a self-consistent ambipolar electric field. It is assumed that the traps are shorter than the zones of uniform magnetic field, that injection of ions proceeds within those zones only and normal to the magnetic force lines, that the mean-free-path of ions in scattering at an angle of approximately  $\sqrt{R-1}$  is longer than the distance between traps, and that electrons have a Boltzmann distribution with the electron temperature sufficiently high to make the braking of ions negligible during their lifetime in a trap. Smallness of the mirror ratio allows retention of the Landau collision integral with respect to velocities  $v_{\parallel}, v_{\perp}$  only those terms which contain the second derivative of the distribution function with respect to  $v_{\parallel}$ . A small mirror ratio yields a plasma lifetime shorter than does standard theory, but this effect can be partly compensated by injection of ions with a large energy variance  $\Delta W \gg W_0(R_{\text{eff}}-1)$ . ## EQUILIBRIUM OF PLASMA WITH FINITE LARMOR RADIUS IN OPEN TRAPS

Moscow FIZIKA PLAZMY in Russian Vol 12, No 10, Oct 86  
(manuscript received 27 Nov 85) pp 1155-1163

[Article by G. V. Stupakov, Institute of Nuclear Physics, Siberian Department,  
USSR Academy of Sciences]

[Abstract] The equilibrium problem for a collisionless plasma with finite Larmor radius in a magnetic-mirror trap is solved by the perholation method this parameter being the ratio of the Larmor radius to plasma confinement radius. First is considered plasma equilibrium in a rectilinear magnetic field, solution to the corresponding two-dimensional equation on the basis of kinetic theory revealing the property of isotropy. Next is considered plasma equilibrium in the curvilinear magnetic field of a paraxial quadrupole-mirror trap. Effects of a finite Larmor radius associated with rotation of the plasma are taken into account in the equilibrium equation, in terms of the same order of magnitude as those accounting for a finite Larmor radius of ions. Equilibrium established in this case is found to destroy the axial symmetry of the preceding MHD solution. Figures 3; references 14: 8 Russian, 6 Western.

CONVERSION OF OPTICAL WAVEGUIDE MODES IN GYROANISOTROPIC PLANAR WAVEGUIDES

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian, Vol 61, No 3, Sep 86  
(manuscript received 23 Jul 85) pp 606-610 (Cat. 10)

[Article by A. A. Solomko, Yu. A. Gayday, A. V. Dovzhenko, M. V. Antonishin  
and A. T. Yanishevskiy]

[Abstract] A study is made of the phenomenon of TE-TM mode conversion in the case of arbitrary film magnetization, in which the role of quadratic magneto-optical coefficients is significant. A three-layer dielectric waveguide is studied, unlimited in the Y direction, consisting of a gyroanisotropic film of cubic ferrite-garnet and isotropic layers with different dielectric permeabilities. The method of coupled modes is used to obtain equations for conversion effectiveness and numerical estimates are presented of wave TE-TM conversion effectiveness in the same waveguide. Optimal conversion conditions are defined. The studies allow determination of optimal mode conversion conditions in arbitrarily magnetized ferrite films. PHOTOEMISSION METHOD OF IDENTIFICATION OF NARROW-BAND SPECTRA IN RAPID PROCESSES

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian, Vol 61, No 3, Sep 86  
(manuscript received 13 Jan 86) pp 615-617 (Cat. 10)

[Article by A. I. Terpuloyeskiy and K. N. Kasparov]

[Abstract] The photoemission method of measurement of optical spectra requires calibration of photomultipliers based on known spectral lines. The major contribution to the error of photoemission measurements is that of disagreement between the half width of the spectra studied and the calibration

spectra. A method is described allowing determination of the position of narrow-band radiation spectra on the energy scale by transmission of an inhibiting potential to the control electrode of the photomultiplier. The major advantages of the method are speed, sensitivity and simplicity. A device has been made to implement the method which can use any photomultiplier as the light receiving device. The time resolution of the device is limited only by the frequency properties of the photomultiplier, the best models of which can record light pulses with lengths of  $10^{-9}$  seconds. [Article by N. N. Yevtikhiyev, D. I. Mirovitskiy, N. V. Rostovtseva and O. B. Serov, Moscow Institute of Radio Engineering, Electronics and Automation]

[Abstract] The possibility is demonstrated of controlling the intensity of all beams in an optoelectronic analog-digital converter utilizing a multilayer hologram by means of a single parameter of the restoration system. The nature of variation in diffraction effectiveness of various orders of the parameter is studied. Several examples are used to illustrate the operation of multilayer holograms as functional holographic memory elements. The studies show that a multilayer thin hologram can be used to divide laser radiation and control the intensity of each beam formed. Design based on two- and four-layer holograms are suggested. It is reported that an experimental device has been developed and used to convert an analog signal to a five-bit digital signal using a two-layer hologram. (manuscript received 21 Nov 85; in final form 18 Feb 86) pp 2455-2457 (Cat. 1)

[Article by A. S. Bakay and N. P. Lazarev, Physical-Technical Institute, Ukrainian Academy of Sciences, Kharkov]

[Abstract] Mechanisms of acceleration of diffusion resulting from the interaction of impurity atoms with mobile edge dislocations and bends on helical dislocations are studied as applicable to the case when the dislocations oscillate in the field of a standing sound wave. The variation in diffusion coefficient as a function of frequency and amplitude of dislocation oscillations is calculated by following an individual atom which diffuses through a regular grid making individual jumps of the same length at characteristic time intervals determined by the energy of migration of the atom in the lattice. ## ASSESSMENT OF ANOMALOUS GRAVITATIONAL FIELD OF ELASTIC EARTH

Alma-Ata IZVESTIYA AKADEMII NAUK KAZAKHSKOY SSR: SERIYA FIZIKO-MATEMATICHESKAYA in Russian No 5(132), Sep-Oct 86 (manuscript received 26 Mar 86) pp 65-69

[Article by Zh.S. Yerzhanov, A.A. Kalybayev and A.N. Isayev, Seismology Institute, Kazakh SSR Academy of Sciences]

[Abstract] The problem of determination of stressed-deformed state and density of Earth, simulated by a rotating elastic self-gravitating sphere, was examined. Using the mass conservation law, Lamé equations were solved, so that the equilibrium figure and force function of the external gravitational field of the model were close to the figure and external Newton potential of the real Earth. As Earth model, a stratified sphere with centrally-symmetric mass distribution was examined; the sphere was represented by an absolutely solid core and a mantle, enclosed by an elastic isotropic lithosphere. Mass distribution in the mantle and lithosphere was derived, based on the characteristic equation of bowels of stars. The selection of Earth model was based on preservation of interfaces, values of density jumps at the interfaces and prehistory of gas-dust origin of Earth, as well as of principal elements of the figure and the external gravitational field and elastic potential of Earth. Because at a given field of mass forces the problem has only one solution, construction of a quasi-solution within the limits of the selected model is correct in the Tikhonov sense. ## PRESSURE AND MASS VELOCITY MEASUREMENTS IN SOLIDS SUBJECTED TO DYNAMIC LOADINGS

Novosibirsk FIZIKA GORENIYA I VZRYVA in Russian Vol 22, No 5, Sep-Oct 86  
(manuscript received 1 Feb 86) pp 113-126

[Article by P.A. Urtiew, R.M. Erikson, B. Hayes and M.L. Parker, Lawrence Livermore National Laboratory, California, USA (translated from English)]

[Abstract] The work was prompted by the need to measure pressure  $p$  and mass velocity  $u$  in reacting medium. Manganine pressure and mass velocity transducers were used for conducting measurements in the reacting medium, as well as for detailed studies of Taylor waves in powerful detonating VV [explosives]. In special cases, when transparent media and free surface movement into vacuum were studied, mass velocity was recorded with a Fabri-Perot velocity meter. Mass velocity measurements were conducted, using foil transducers. Two types of mass velocity transducers were used: Faraday and Lorentz. Depending on application, they can be made from copper or aluminum. Although copper does not agree in impedance as well as aluminum, it operates better than aluminum in detonation products. Experimental results were compared to results of calculations, using the proposed reaction velocity model. In order to avoid physical contact with the studied material surface, a Fabri-Perot velocity measurement system was used. An argon laser with maximum capacity of 4 W in a single-mode single-frequency mode and wavelength equal to 514.5 nm was used as a light source. In order to get a sufficiently good idea of the unloading isentrophy behind a detonation wave [DV], experiments in water were conducted. Pressure measurements were conducted, using manganine foil transducers. They were etched according to the standard procedure and made from annealed foil, 0.001 inch thick. They were connected according to a four-point arrangement. One or several transducers, placed between teflon layers, formed a "station". A fluoroethylenepropylene film was used as a bonding medium. Experimental data for pressure and mass velocity in a reacting medium can be used in calculating reaction progress under moderate dynamic loading. A polyvinylidenefluoride (PVF<sub>2</sub>) based transducer was used for dynamic velocity measurements. At present, it is only in the early development stage. Its operating principle is very simple; unlike foil transducers, it does not need power source, as it uses its own accumulated energy, released under compression. Despite the fact that development of the transducer has not been finished yet, experimental results demonstrated monotonic dependence between pressure and the charge. The four described diagnostic procedures can be used together in the same experiment and even in

the same plane, which is important for cross-testing experimental results. The only exception is the combination of manganine pressure and mass velocity transducers that cannot be used in close proximity to each other due to unavoidable interference of two magnetic fields, induced by currents that power the transducers. [Abstract] In a 1984 experiment on the "Kosmos-1543" satellite were measured, with a "Sokol" instrument, the energy spectra and the charge contents of particles in primary cosmic rays with energy  $E \geq 2$  TeV. The instrument included a segmental ionization calorimeter with an absorber sufficiently thick (5.5 mean free paths) to allow proton-proton interaction and two Cerenkov-radiation detectors above the calorimeter. The lower detector consisted of 11 directional counters made of 5 cm thick Plexiglas for measurement of charges with multiplicity  $z = 1-5$ , the upper one consisted of 4 counters made of 1 cm thick Plexiglas for measurement of charges with multiplicity  $z = 5-50$ . The longitudinal axis of the "sokol" instrument was oriented vertically throughout the experiment. Events were recorded in which the pulse amplitude in at least one of the detectors exceeded 30% of the probable amplitude of a pulse produced by a single-charge relativistic particle, in which the total energy released in the calorimeter exceeded 1 TeV, and in which at any 8 out of 10 monitored calorimeter energy levels the energy released in the absorber exceeded 35 GeV. The amplitudes of pulses in all 95 "Sokol" probes were read when all these three conditions had been satisfied simultaneously. The total net time of measurements was accordingly 257 hours, in which over 10,000 events were recorded. With a geometrical factor of 325 cm<sup>2</sup>. steradians, only 2000 of those events occurred within the space sector of the instrument and were used for the analysis. Only consistent readings of the two detectors in the path of a primary particle were used for the analysis. The results of that analysis indicate that the charge content of primary nuclei with charge multiplicity  $z \geq 2$  and energy  $E \geq 2$  TeV does not significantly differ from the charge content of those with energy  $E > 1-10$  GeV per nucleon. ## EXPLOSIVE ABSORPTION OF LASER BEAM OF FINITE DIAMETER

Moscow KVANTOVAYA ELEKTRONIKA in Russian Vol 13, No 7, Jul 86  
(manuscript received 20 May 85) pp 1467-1472

[Article by A. N. Orayevskiy and I. Ye. Protsenko, Institute of Physics  
imeni P. N. Lebedev, USSR Academy of Sciences, Moscow]

[Abstract] Explosive absorption of an infrared laser beam such as a CO<sub>2</sub>-laser beam by molecules during transitions between excited states is analyzed, assuming a quasi-equilibrium distribution of molecules over levels of the absorbing mode approximately identical to the Boltzmann distribution for a harmonic oscillator with the VT-relaxation time for the n-th level  $\tau_{VT}^{(n)} = n\tau_{VT}^{(1)}$ . This model is adequate for a system with small anharmonicity of the absorbing mode  $\omega_n - \omega_{n+1} \ll kT$  and with the characteristic time of each other process much shorter than that of VV-exchange. First the effect of heat transfer within the laser beam of finite diameter on the dynamics of explosive absorption is evaluated, on the basis of the system of two equations of kinetics for vibrational energy  $E_v$  and translational temperature  $T$  of molecules. The stability limit of its steady-state solution for boundary conditions  $E_v(0,t)$  and  $T(0,t)$  is determined in accordance with the theory of thermal explosion. Next are determined the characteristics of explosive absorption related to finiteness of the VV-exchange rate, not so much higher than the VT-relaxation rate, and consequent departure of the Boltzmann distribution over vibrational levels from equilibrium. Analysis and solution of the corresponding system of three equations of kinetics, for vibrational energy  $E_v$  and populations  $N_1, N_2$  of levels  $n, n+1$  respectively, reveal that the threshold of explosive absorption depends on both the laser beam diameter and the laser pulse duration. Estimates indicate the possibility of explosive absorption of CO<sub>2</sub>-laser radiation by molecules such as D<sub>2</sub>O, O<sub>3</sub>, NF<sub>3</sub>, and NH<sub>3</sub>. Pumping of NH<sub>3</sub> molecules with a CO<sub>2</sub>-laser is of particular interest, in connection with development of a transverse-excitation high-pressure NH<sub>3</sub>-laser. A cell containing any such gas can also be used as an "absorbing lock" not passing a laser beam of intensity higher than the absorption threshold, or for smoothing laser intensity fluctuations. The hysteresis of the  $E_v(P)$  relation, dependence of the vibrational energy on the laser pulse power, can be utilized for a new class of logic devices. # STUDY OF RESONANCE ELECTRON TUNNELING UNDER SCANNING ELECTRON-TUNNELING MICROSCOPE

Moscow PISMA V ZHURNAL EKSPERIMENTAL'NOY I TEORETICHESKOY FIZIKI in Russian  
Vol 44, No 6, 25 Sep 86 (manuscript received 24 Apr 86, after revision  
11 Aug 86) pp 287-290

[Article by M. Yu. Sumetskiy, Leningrad Institute of Electrical Communications Engineering imeni M. A. Bonch-Bruyevich]

[Abstract] A theory of resonance electron tunneling through point defects in an insulator film is constructed, applicable to microstructural examination of thin films under a scanning electron-tunneling microscope. The theory is based on quasi-classical electron ballistics, including the Hamiltonian of electron motion and the electron wave function. The potential distribution is assumed to be axisymmetric within the vacuum clearance separating the film on a substrate from the tip of the microscope needle and to be uniform around a well of zero radius simulating a defect. The corresponding Schroedinger equation for the film region has separable variables and is solved by continuation of a spherical standing wave from the film surface up to the microscope needle as well as down into the substrate. The tip of the needle, closest to a defect, is assumed to be a paraboloid of revolution. The needle, usually with feedback, tracks a constant electron current equal to the integral of the product of the electron states density and the Fermi distribution function. An expression is obtained accordingly for the trajectory of the microscope needle above a defect in the film, this trajectory being independent of the temperature and of the electron states density. The author thanks B. L. Al'tshuler for helpful discussion and G. N. Fursey for support. Figures 2; references 14: 5 Russian, 9 Western (1 in Russian translation).

# ANOMALOUS THERMAL DIFFUSIVITY AND CONDUCTIVITY OF V, Nb, Ta NEAR MELTING POINT

Leningrad FIZIKA TVERDOGO TELA in Russian Vol 28, No 9, Sep 86  
(manuscript received 24 Dec 85, in final version 31 Mar 86) pp 2914-2917

[Article by V. Ye. Zinovyev, V. F. Polev, S. G. Taluts and P. V. Geld, Institute of Mining imeni V. V. Vakhrushev, Sverdlovsk]

[Abstract] A method has been developed for measuring the thermal diffusivity of any metal near its melting point not only in the solid state but also in the liquid state. The method combines use of a plane heat wave with a fast change of the mean temperature. Measurements are made in a configuration where a flat specimen melts only at the center while its thickness

elsewhere is maintained constant for a fraction of a second by a hydrodynamic mechanism. This method was applied to subgroup-5b metals V, Nb, Ta within the  $(0.6-1.05)T_{\text{melt}}$  temperature range of each. The specimens were disks, 8-10 mm thick and 5-6 mm in diameter, of polycrystalline V, Nb, Ta with respectively 0.05%, 0.11%, 0.10% impurity and of high-purity Nb, Ta single crystals oriented with the 110 axis in the direction of heating. A disk was heated at a rate of 200-1000°C/s up to 50-150 K above the melting point under a vacuum of the order of  $10^{-4}$  Pa and formation of a 0.2-0.3 mm thick liquid film at the center, with modulation of the heat wave at a frequency of 150-500 Hz. The phase of the heat wave was measured automatically during each modulation period and the readings were processed by an Elektronika-60 microcomputer. The results reveal a decrease of the thermal diffusivity of all three metals as the temperature rises toward the melting point, with an anomalous increase immediately before the point at which the center melts followed by a steep decrease to a constant level up to the point at which the thickness begins to change. Calculation of the thermal conductivity and its electronic component according to the Wiedemann-Frantz-Lorentz law yields an almost purely electronic thermal conductivity at temperatures  $T < 0.9 T_{\text{melt}}$ , also at temperatures  $T > T_{\text{melt}}$ , but a thermal conductivity higher than that by an amount increasing as the melting point is approached. This increment of thermal conductivity cannot be attributed to the phonon mechanism of heat transfer but, because of its exponential temperature dependence, could probably be regraded as a vacancy thermal conductivity. TWO-PHOTON ABSORPTION OF IONS IN A TWO-DIMENSIONAL CLOSED TRAP

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian, Vol 61, No 2, Aug 86  
(manuscript received 13 Feb 85) pp 261-266 (Cat. 10)

[Article by V. A. Ulybin and V. P. Chebotayev]

[Abstract] A discussion is presented of the possibility of producing narrow optical resonances with high intensity by two-photon absorption of ions in a two-dimensional closed trap. Such a trap is obtained from a linear quadrupole mass filter by bending the electrodes into a racetrack configuration. The racetrack configuration increases the number of particles interacting with the light beam, increasing intensity. Two-photon absorption of ions in a racetrack trap is a very promising method for the production of optical resonances with bandwidth determined by the radiation lifetime of particles in the metastable state. The intensity of the two-photon resonance is primarily determined by the number of ions in the trap and may be as much as 100 times greater than the amplitude of resonance in ordinary three dimensional electromagnetic traps. This high intensity of resonance gives hope for successful use of such a device as a standard for laser frequency stabilization, achieving frequency stability of  $10^{-15}$  or better. # INFLUENCE OF PERMANENT MAGNETIC FIELD ON RELAXATION CHARACTERISTICS OF AN ATOM IN A RESONANT FIELD OF RADIATION

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian, Vol 61, No 3, Sep 86  
(manuscript received 27 Jun 85) pp 457-460 (Cat. 9)

[Article by T. Ya. Karagodova]

[Abstract] The elements of the scattering matrix are determined for atoms in a strong resonant field of radiation and a constant magnetic field. The elements can be used to determine the relaxation characteristics of the system. The variation of these elements as a function of magnetic field intensity is studied. The system of equations for the elements of the scattering matrix obtained for the case of an alkaline atom breaks down for circular polarization of the radiation. An analytic solution is obtained for two magnetic sublevels coupled by the field of radiation. The results show that the magnetic field intensity not only influences the applicability of a given approximation for determination of the elements of the S matrix, but also is included in explicit form in the expression for these elements, influencing the relaxation characteristics of the system. # THEORETICAL CALCULATION OF EINSTEIN COEFFICIENTS OF NEW VIBRATIONAL TRANSITIONS IN CO<sub>2</sub> MOLECULE

Leningrad OPTIKA I SPEKTROSKOPIYA in Russian, Vol 61, No 3, Sep 86  
(manuscript received 27 Mar 86) pp 441-445 (Cat. 9)

[Article by S. M. Zavoruyev, V. A. Pivovar, R. I. Rakauskas and Yu. K. Shulskus]

[Abstract] The electron wave functions of 51 different geometric configurations were calculated for the base electron state of the CO<sub>2</sub> molecule. The lengths of the O-C bonds were varied from 2.0 to 2.4 atomic units, the angle O-C-O was varied from 140° to the equilibrium position of 180°. The numerically calculated potential surface was approximated analytically by the method of least squares to produce values of partial derivatives in the internal coordinates up to the fourth order. The vibrational problem in its nonharmonic approximation was solved by a variational method. The calculated values thus obtained were slightly higher than experimental values, but of the same order of magnitude, indicating the reliability of the calculated values of the Einstein coefficients for new, as yet unstudied experimental transitions with high vibrational levels. CHANNELLING OF ULTRARELATIVISTIC ELECTRONS: DOES THIS PHENOMENON EXIST?

Moscow DOKLADY AKADEMII NAUK SSSR in Russian Vol 288 No 1, 1986 (manuscript received 11 Jun 85) pp 105-107

[Article by V.A. Bazylev, V.I. Glebov and V.V. Goloviznin, Atomic Energy Institute imeni VI.V. Kurchatov; presented by Academician S.T. Belyayev 30 May 85]

[Abstract] The idea of channelling of electrons and of channeling emission, that presumes the presence of adiabatic invariants of motion and seems rather natural for positively charged particles, is not so obvious for negatively charged particles; therefore, additional studies of the problem of existence of adiabatic invariants of motion were conducted. For simplicity, the case of plain electron channelling was examined. A conclusion was made that the generally accepted idea of channelling of high energy electrons as a quasiperiodic motion, accompanied by relatively slow particle "diffusion" in the transverse energy space is invalid, as there is no electron channelling in this sense. The only meaning this term could have would be the presence of strong bending of electron trajectory in the atomic chains (planes) field. Detailed calculations for the case of axial channelling will be presented in forthcoming publications. References 10: 9 Russian, 1 Western.

STUDIES OF MONOPOLISTIC EXCITED STATES OF  $^{12}\text{C}$  NUCLEUS IN 3 ALPHA-PARTICLE MODEL

Moscow IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA in Russian Vol 50, No 10, Oct 86 pp 1967-1973

[Article by R.I. Dzhibuti, T.Ya. Mikhelashvili (Physics Institute, Georgian SSR Academy of Sciences) and K.V. Shitikova (Scientific Research Institute of nuclear physics, Moscow State University imeni M.V. Lomonosov)]

[Abstract] Binding energy, energy of excitation of monopolistic states, mean square radii, a form factor and the energy-weighted monopolistic sum of the  $^{12}\text{C}$  nucleus in an alpha-particle model were calculated, using a microscopic approach, based on solving a three-particle Schrodinger equation, using expansion in terms of a translation-invariant oscillator basis (TIMO). The oscillator basis method was based on expanding the wave function of the studied nucleus in terms of a complete set of eigenfunctions of a translation-invariant oscillator hamiltonian. In order to derive binding energy of the basic and first excited  $0^+$ -states of the  $^{12}\text{C}$  nucleus, the energy matrix was diagonalized. The derived wave functions were used for calculating the mean square radius, elastic charge form factor and density of the  $^{12}\text{C}$  nucleus. Also derived was the monopolistic operator. In order to study the basis convergence and assess the accuracy of derived results, the dependence between the energy of the basic and the first excited  $0^+$ -state, the mean square radius and the charge form factor, on one hand, and the oscillator parameter and excitation quantum  $N$ , on the other, was studied. It was determined that, as  $N$  increases, the dependence between binding energy and the oscillator parameter weakens and practically disappears at  $N = 22$ . Calculation results demonstrated that theoretical curves of charge form factor for various values of the oscillator parameter hardly differed from each other and that they equally well described the first diffraction minimum, observed in experiments. On the whole, calculations had demonstrated that results of theoretical studies, obtained when using the TIMO method within the framework of the alpha-cluster model, agreed with results of calculations that used the hyperspheric functions method. The examined method makes it possible to perform all calculations in an analytical form. Figures 4, tables 3, references 6: 3 Russian, 3 Western.

## COHERENT EMISSION OF HIGH-ENERGY PHOTONS AND PI-MESONS IN REACTIONS WITH HEAVY IONS

Moscow IZVESTIYA AKADEMII NAUK SSSR: SERIYA FIZICHESKAYA in Russian Vol 50, No 10, Oct 86 pp 2038-2042

[Article by I.S. Batkin and I.V. Kopytin (Voronezh State University)]

[Abstract] A microscopic approach was proposed to describing subthreshold generation of pions and high-energy photons in ion-ion collisions, which does not use any adjustment parameters. The range of colliding ions energy from 40 to 100 MeV per nucleon and emitted particle energy from 50 to 150 MeV was examined. The model was based on the assumption that the initial collision stage (the "braking" stage), that had been previously paid little attention in theoretical studies, plays an important role in forming the output of emitted particles. Under this approach, cooperative properties of colliding systems that are manifested in collision dynamics, play the main role in the energy transmission mechanism, and the result depends on charge or spin distributions, two-nucleon correlation functions and properties of the potential of internuclear interaction of colliding nuclei. Based on derived formulae, calculations of differential cross-sections were performed in the case of collisions of  $^{12}\text{C}$  and  $^{238}\text{U}$  ions with kinetic energy of relative motion 84 MeV per nucleon; the calculations were performed in the gamma-quantum energy range from 40 to 180 MeV and pion kinetic energy range from 40 to 160 MeV. Results of calculations were compared to experimental data, obtained earlier by H. Noll, E. Grosse et al. The calculations were in good agreement with the experiments. Similar formation mechanisms of high-energy emission and subthreshold pion generation in nucleus-nucleus collisions, detected in the abstracted work, point to the possibility of integrated studies of these reactions. Figures 2, references 21: 2 Russian, 19 Western.
